

## Amiloride

Cat. No.:	HY-B0285		
CAS No.:	2609-46-3		
Molecular Formula:	C <sub>6</sub> H <sub>8</sub> ClN <sub>7</sub> O		
Molecular Weight:	230		
Target:	Sodium Channel; TRP Channel; Apoptosis		
Pathway:	Membrane Transporter/Ion Channel; Neuronal Signaling; Apoptosis		
Storage:	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	6 months
		-20°C	1 month

### SOLVENT & SOLUBILITY

In Vitro	DMSO : 120 mg/mL (521.74 mM; Need ultrasonic)					
	Preparing Stock Solutions	<div>Solvent Concentration</div>	Mass	1 mg	5 mg	10 mg
		1 mM		4.3478 mL	21.7391 mL	43.4783 mL
		5 mM		0.8696 mL	4.3478 mL	8.6957 mL
		10 mM		0.4348 mL	2.1739 mL	4.3478 mL
Please refer to the solubility information to select the appropriate solvent.						
In Vivo	1. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline Solubility: ≥ 3 mg/mL (13.04 mM); Clear solution					
	2. Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline) Solubility: ≥ 3 mg/mL (13.04 mM); Clear solution					

### BIOLOGICAL ACTIVITY

Description	Amiloride (MK-870) is an inhibitor of both epithelial sodium channel (ENaC <sup>[1]</sup> ) and urokinase-type plasminogen activator receptor (uTPA <sup>[2]</sup> ). Amiloride is a blocker of polycystin-2 (PC2; TRPP2 <sup>[3]</sup> ) channel.
IC <sub>50</sub> & Target	ENaC <sup>[1]</sup> ; uTPA <sup>[2]</sup> ; polycystin-2(TRPP2) <sup>[3]</sup>
In Vitro	Amiloride blocks δβγ channels with an IC <sub>50</sub> of 2.6 μM (58, 71, 75, 134, 148). The K <sub>i</sub> of amiloride for δβγ ENaC is 26-fold that of αβγ channels (0.1 μM for αβγ ENaC). Amiloride blockade of δβγ ENaC is much more voltage dependent compared with the αβγ channel. The K <sub>i</sub> of amiloride for δαβγ channels is 920 and 13.7 μM at -120 and +80 mV, respectively, which significantly differs from that of both αβγ and δβγ channels <sup>[1]</sup> . Amiloride is a relatively selective inhibitor of the epithelial sodium channel (ENaC) with an IC <sub>50</sub> (the concentration required to reach 50% inhibition of an ion channel) in the concentration range of 0.1

to 0.5  $\mu\text{M}$ . Amiloride is a relatively poor inhibitor of the the  $\text{Na}^+/\text{H}^+$  exchanger (NHE) with an  $\text{IC}_{50}$  as low as 3  $\mu\text{M}$  in the presence of a low external  $[\text{Na}^+]$  but as high as 1 mM in the presence of a high  $[\text{Na}^+]$ . Amiloride is an even weaker inhibitor of the  $\text{Na}^+/\text{Ca}^{2+}$  exchanger (NCX), with an  $\text{IC}_{50}$  of 1 mM. Amiloride (1  $\mu\text{M}$ ) and submicromolar doses of Benzamil (30 nM), doses known to inhibit the ENaC, inhibit the myogenic vasoconstriction response to increasing perfusion pressure by blocking the activity of ENaC proteins. Amiloride completely inhibits  $\text{Na}^+$  influx in doses known to be relatively specific for ENaC (1.5  $\mu\text{M}$ ) in vascular smooth muscle cells (VSMC)<sup>[2]</sup>.

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

#### In Vivo

Amiloride (1 mg/kg/day) subcutaneously is found to reverse the initial increases in collagen deposition and prevent any further increases in the DOCA-salt hypertensive rat. Amiloride delays the onset of proteinuria and improved brain and kidney histologic scores in the saline-drinking, stroke-prone spontaneously hypertensive rats (SHRSP) compared with controls. Amiloride antagonizes or prevents actions of aldosterone in these cells and in cardiovascular and renal tissues in animals with salt-dependent forms of hypertension<sup>[2]</sup>.

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
