BIOLOGICAL ACTIVITY

Description	Sulbutiamine is a synthetic analogue of vitamin B1 used for the treatment of asthenia.
In Vitro	<p>Sulbutiamine shows neuroprotective effects on hippocampal CA1 pyramidal neurons subjected to oxygen-glucose deprivation. Sulbutiamine enhances electrophysiological properties such as excitatory synaptic transmissions and intrinsic neuronal membrane input resistance in a concentration-dependent manner^[1]. Sulbutiamine attenuates apoptotic cell death induced by serum deprivation and stimulates GSH and GST activity in a dose dependent manner. Furthermore, sulbutiamine decreases the expression of cleaved caspase-3 and AIF^[2].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
