Inhibitors • Screening Libraries • Proteins

hsa-miR-548ah-3p inhibitor

Cat. No.:	HY-RI01640
Molecular Weight:	6656.42
Target:	MicroRNA
Pathway:	Epigenetics
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY		
Description hsa-miR-5 inhibitors	648ah-3p inhibitors are chemically-modified oligonucleotides that hybridize with mature miRNAs. The miRNA have full-length nucleotide 2'-methoxy modification. The miRNA inhibitors strongly compete with mature miRNAs t the complementary pairing of miRNAs and their target genes, thereby inhibiting miRNAs from functioning.	
1.1 Briefly1.2 ResuspFor 5 nmoFor 20 nm1.3 Aliquo1.4 Store a2. Prepare2.1 InoculaNote: The3. Transfe3.1 PreparePolyFast TFor per wePolyFast TFor per wePolyFast TFor per we	ate cells in advance for cell transfection. viability and general health of cells prior to transfection significantly affect transfection result.	

Note: The recommended working concentration is 100nM for miRNA inhibitors. miRNA function can vary greatly, depending on the miRNA, the cell line, and the chosen analysis method. To determine the concentration that provides optimal results, optimization experiments using varying mimic/inhibitor concentrations should be performed. The optimized range suggests changing the miRNA concentration in the range of 20 to 500nM.

If other transfection reagents are used, the amount of transfection reagent needs to be adjusted according to the specific situation.

3.2 Mix the diluted PolyFast Transfection Reagent and miRNA gently. Incubate at room temperature for 15 minutes.

3.3 Remove culture medium from cells, wash with PBS.

3.4 Add transfection mix (A+B) to cells.

For per well of a 6-well plate: add 1750 μ L fresh medium without Pen/Strep, then add 250 μ L of the transfection mix (A+B) to the well, and mix well.

For per well of a 24-well plate: add 450 μ L fresh medium without Pen/Strep, then add 50 μ L of the transfection mix (A+B) to the well, and mix well.

For per well of a 96-well plate: add 90 μ L fresh medium without Pen/Strep, then add 10 μ L of the transfection mix (A+B) to the well, and mix well.

3.5 Incubate cells for 1–3 days at 37°C. Then, analyze transfected cells. The medium can be replaced with fresh serumcontaining medium after 6 hours if necessary.

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Caution: Product has not been fully validated for medical applications. For research use only.
