2-PCCA hydrochloride

Cat. No.: HY-100013C
Molecular Formula: C₃₀H₃₈ClN₃O
Molecular Weight: 492.1
Target: Others
Pathway: Others
Storage:
- Powder: -20°C 3 years, 4°C 2 years, In solvent -80°C 6 months, -20°C 1 month

BIOLOGICAL ACTIVITY

Description
2-PCCA hydrochloride is a GPR88 receptor agonist, and inhibits GPR88-mediated cAMP production, with an EC₅₀ of 116 nM in HEK293 cells.

IC₅₀ & Target
EC₅₀: 116 nM (GPR88 receptor, HEK293 cells)[1]

In Vitro
2-PCCA hydrochloride inhibits GPR88-mediated cAMP production through a Gαι-coupled pathway, with an EC₅₀ of 116 nM in HEK293 cells stably expressing the human GPR88 receptor and the GloSensor-22F cAMP construct[2].

In Vivo
2-PCCA (0.1-3.2 mg/kg, i.p.) decreases the locomotor activity in rats in a dose-dependent manner in rats. 2-PCCA combined with 1.0 mg/kg methamphetamine also dose-dependently reduces methamphetamine-induced hyperactivity. 2-PCCA (1-3.2 mg/kg, i.p.) alone does not produce methamphetamine-like discriminative stimulus effects, or alter the discriminative stimulus effects of methamphetamine, when studied in combination[1].

PROTOCOL

Animal Administration[1]
Rats[1]
For the locomotor activity tests, rats are only used once. The test is conducted in an adjacent room from the animal colony room with similar environmental conditions (light, temperature and humidity). Before tests begin, rats are exposed to at least three days of handling by the experimenter. When only 2-PCCA (1.0 and 3.2 mg/kg) is studied, the drug is (i.p.) injected immediately before the rats are put into the test chambers and the locomotor activity is simultaneously recorded for 60 min. When 2-PCCA is studied in combination with methamphetamine, the locomotor activity is recorded for 20 min and then both drugs are simultaneously injected and the locomotor activity is recorded for 120 more min[1].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
