

SX-3228

Cat. No.:	HY-100291
CAS No.:	156364-04-4
Molecular Formula:	C ₁₈ H ₁₈ N ₄ O ₃
Molecular Weight:	338.36
Target:	GABA Receptor
Pathway:	Membrane Transporter/Ion Channel; Neuronal Signaling
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	SX-3228 is a selective benzodiazepine1 (BZ1) receptor agonist with an IC ₅₀ of 17 nM.
IC₅₀ & Target	IC ₅₀ : 17 nM (BZ1 receptor) ^[1]
In Vitro	<p>SX-3228 is a selective ligand for the BZ1 receptor. Among the BZ-receptor subtypes, SX-3228 preferentially binds to the BZ1 receptor (IC₅₀=17 nM). It has very weak affinity for the BZ2 receptor (spinal cord: IC₅₀=127 nM), and virtually no affinity for the peripheral type BZ receptor (kidney: IC₅₀>10000 nM). A compound with similar selectivity, SX-3228 has been shown to bind to BZ receptors, but not to dopamine (D₁, D₂), serotonin (5-HT₁, 5-HT₂ and 5-HT₃ subtypes), noradrenaline (α₁, α₂, β), GABA or acetylcholine (muscarinic) subtypes^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
In Vivo	<p>Administration of 0.5-2.5 mg/kg SX-3228 to rats during the light phase induces a significant reduction of rapid-eye-movement sleep (REMS) (P<0.05) during the third recording hour. Administration of SX-3228 (0.5-2.5 mg/kg) at the beginning of the dark period significantly and dose-dependently reduces waking (W) and increases slow wave sleep (SWS) during the 6-h recording period (P<0.05-0.01); however, significant changes during the last recording hour are restricted to the 2.5 mg/kg dose (P<0.01)^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>

PROTOCOL

Animal Administration ^[1]	<p>Rats^[1]</p> <p>Twelve male Wistar rats (350-380 g) are used. Subcutaneous (sc) injections are given in a final volume of 1.0 mL/kg. All rats are given the corresponding volume of control solution (saline+Tween-80) in the control sessions. Following sc injection, a 6-h sleep recording is started at approximately 8:00 a.m. At least 4 days are allowed to elapse between injections to avoid long-lasting and rebound effects on sleep. The effects of SX-3228 0.5-2.5 mg/kg are studied in one group of animals (N=6) during the light phase of the 12-h light:12-h dark cycle, starting 1 h after the beginning of the light period. Polysomnographic recordings are started immediately after control solution or drug administration. Each rat receives all four treatments (control, and 0.5, 1.0, 2.5 mg/kg SX-3228).</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
