

Veliparib

Cat. No.:	HY-10129		
CAS No.:	912444-00-9		
Molecular Formula:	C ₁₃ H ₁₆ N ₄ O		
Molecular Weight:	244.29		
Target:	PARP; Autophagy		
Pathway:	Cell Cycle/DNA Damage; Epigenetics; Autophagy		
Storage:	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	1 year
		-20°C	6 months

SOLVENT & SOLUBILITY

In Vitro

DMSO : ≥ 29 mg/mL (118.71 mM)
 * "≥" means soluble, but saturation unknown.

	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
Preparing Stock Solutions	1 mM	4.0935 mL	20.4675 mL	40.9350 mL
	5 mM	0.8187 mL	4.0935 mL	8.1870 mL
	10 mM	0.4093 mL	2.0467 mL	4.0935 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
 Solubility: ≥ 2.08 mg/mL (8.51 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
 Solubility: ≥ 2.08 mg/mL (8.51 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil
 Solubility: ≥ 2.08 mg/mL (8.51 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

Veliparib (ABT-888) is a potent PARP inhibitor, inhibiting PARP1 and PARP2 with K_s of 5.2 and 2.9 nM, respectively^[1].

IC₅₀ & Target

PARP-2 2.9 nM (K _i)	PARP-1 5.2 nM (K _i)	Autophagy
------------------------------------	------------------------------------	-----------

In Vitro

Veliparib (ABT-888) is also tested against SIRT2, an enzyme that also uses NAD⁺ for catalysis, and found to be inactive (>5,000

nM). The receptor profile of Veliparib is determined in a panel of 74 receptor-binding assays at a concentration of 10 μ M. Veliparib displaces control-specific binding at 50% or greater at the human H₁(61%), the human 5-HT_{1A} (91%), and the human 5-HT₇ (84%) sites only. The IC₅₀s for these three receptors are 5.3, 1.5, and 1.2 μ M, respectively^[1].

c-Met knockdown cells show 4.2- (shMet-A; 95% CI=4-4.5) or 4.6-fold (shMet-B; 95% CI=4.4-4.8) growth inhibition when treated with 60 μ M Veliparib (ABT-888). When treated with 38 μ M Veliparib, c-Met knockdown cells show 2- (shMet-A; 95% CI=1.5-2.5) or 1.9-fold (shMet-B; 95% CI=1.3-2.5) growth inhibition^[2].

In HaCaT cells, at 6 h post-treatment by Veliparib (ABT-888), cell viability is significantly increases under 1,000 μ M sulfur mustard (SM) exposure, whereas Veliparib does not protect cell viability under 100 μ M SM exposure. Moreover, the addition of Veliparib no longer shows the protective effect at 24 h post SM exposure^[3].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

In Vivo

Veliparib (ABT-888) is a potent inhibitor of PARP, has good oral bioavailability, can cross the blood-brain barrier in syngeneic and xenograft tumor models^[1]. In MDA-MB-231 xenograft tumor models, combination treatment (AG014699/PF-02341066 and Veliparib (ABT-888)/Foretinib) substantially reduced tumor growth compared to either inhibitor alone^[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Kinase Assay ^[2]

PARP1 enzyme activity is measured by using a commercial assay kit with the exception that cell lysates containing wild-type PARP1 or PARP Y907 mutant are used in place of the PARP1 protein included with the kit. Total lysate (500 ng) is added to each reaction. The dose course of PARP inhibitor Veliparib (ABT-888) is from 0.01 to 1,000 μ M. PARP enzyme activity of wild-type and mutants is determined after incubation with the substrate is measured using a plate reader^[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Cell Assay ^[3]

Cell viability is quantified using the Cell Counting Kit-8 (CCK-8). This assay is based on Dojindo's highly water-soluble tetrazolium salt. WST-8 is reduced by dehydrogenases in cells to give an orange, water-soluble formazan dye. The amount of the formazan dye generated by dehydrogenases in cells is directly proportional to the number of living cells. Briefly, exponentially growing HaCaT cells are seeded in 96-well plates at a density of 10,000 cells/well. 6 h or 24 h after exposure to sulfur mustard (SM) and the administration of Veliparib, the CCK-8 reagent is added^[3].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Administration ^[2]

Mice^[2]

MDA-MB-231 (0.5 \times 10⁶), HCC1937 (2 \times 10⁶) or MCF-7 (5 \times 10⁶) cells are injected into the mammary fat pads of female nude (Swiss Nu/Nu) mice of 6-8 weeks of age. A1034 (0.5 \times 10⁶) cells are injected into the mammary fat pads of female FVB/NJ mice of 6-8 weeks of age. H1993 (0.5 \times 10⁶) cells are injected subcutaneously into the right flank of female nude (Swiss Nu/Nu) mice of 6-8 weeks of age. When the tumor volume reaches 50 mm³, PF-02341066 (5 mg/kg) and Foretinib (5 mg/kg), AG014699 (5 mg/kg) and Veliparib (25 mg/kg), dissolved in aqueous 50 mM sodium acetate, pH 4, are administered to mice five times per week as single agents or in combination for the number of days specified in the figure legend. Tumor is measured at the indicated time points, and tumor volume is calculated by the formula: $\pi/6 \times \text{length} \times \text{width}^2$. For MDA-MB-231 and A1034 xenograft mouse models, mice are imaged before and after treatment using the IVIS Imaging System to assess tumor growth. Mice are injected with 100 μ L of D-luciferin (15 mg/mL in PBS).

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
