

## NAS181

Cat. No.:	HY-103156
CAS No.:	1217474-40-2
Molecular Formula:	C <sub>21</sub> H <sub>34</sub> N <sub>2</sub> O <sub>10</sub> S <sub>2</sub>
Molecular Weight:	538.63
Target:	5-HT Receptor
Pathway:	GPCR/G Protein; Neuronal Signaling
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

### BIOLOGICAL ACTIVITY

<b>Description</b>	<p>NAS181 is a potent and selective antagonist of rat 5-HT<sub>1B</sub> receptor, with a K<sub>i</sub> of 47 nM. NAS181 shows 13-fold selectivity for r5-HT<sub>1B</sub> over bovine 5-HT<sub>1B</sub> receptor (K<sub>i</sub>=630 nM). NAS181 increases the 5-HT turnover and the synaptic concentration of 5-HT by inhibiting terminal r5-HT<sub>1B</sub> autoreceptors<sup>[1][2]</sup>.</p>									
<b>IC<sub>50</sub> &amp; Target</b>	<p>Rat 5-HT<sub>1B</sub> Receptor 47 nM (IC<sub>50</sub>)</p>									
<b>In Vitro</b>	<p>NAS181 has very low affinities (K<sub>i</sub>&gt;3000 nM) for all other receptors examined, including 5-HT<sub>2A</sub>, 5-HT<sub>2C</sub>, 5-HT<sub>6</sub>, and 5-HT<sub>7</sub>, α<sub>1</sub>-, α<sub>2</sub>-, and β-adrenoceptors, and dopamine D<sub>1</sub> and D<sub>2</sub><sup>[1]</sup>.          NAS181 (10-1000 nM) dose-dependently potentiates the K<sup>+</sup>-stimulated [<sup>3</sup>H]-5-HT release in preloaded rat occipital cortical slices<sup>[1]</sup>.          MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>									
<b>In Vivo</b>	<p>NAS181 (1-10 mg/kg; s.c.) dose-dependently increases acetylcholine (ACh) release in the frontal, ventral hippocampus cortex and VHipp<sup>[1]</sup>.          NAS181 (20 mg/kg; s.c.) enhances the 5-HT turnover in four rat brain regions (hypothalamus, hippocampus, striatum, and frontal cortex) with about 40%<sup>[1]</sup>.          NAS181 (3 mg/kg; s.c.) produces a significant increase in the number of wet dog shakes in rats<sup>[1]</sup>.          MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1"> <tr> <td>Animal Model:</td> <td>Adult male Sprague-Dawley rats (250-300 g)</td> </tr> <tr> <td>Dosage:</td> <td>1, 5, 10 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>S.c. in the scruff of the neck</td> </tr> <tr> <td>Result:</td> <td> <p>Increased the ACh release in the frontal cortex, reaching the maximal value of 500% of the control group within 80 min after the injection of the highest dose.</p> <p>Increased the ACh releases in VHipp with a maximum of 230% of the control values at 80 min after the injection of the highest dose.</p> </td> </tr> </table>		Animal Model:	Adult male Sprague-Dawley rats (250-300 g)	Dosage:	1, 5, 10 mg/kg	Administration:	S.c. in the scruff of the neck	Result:	<p>Increased the ACh release in the frontal cortex, reaching the maximal value of 500% of the control group within 80 min after the injection of the highest dose.</p> <p>Increased the ACh releases in VHipp with a maximum of 230% of the control values at 80 min after the injection of the highest dose.</p>
Animal Model:	Adult male Sprague-Dawley rats (250-300 g)									
Dosage:	1, 5, 10 mg/kg									
Administration:	S.c. in the scruff of the neck									
Result:	<p>Increased the ACh release in the frontal cortex, reaching the maximal value of 500% of the control group within 80 min after the injection of the highest dose.</p> <p>Increased the ACh releases in VHipp with a maximum of 230% of the control values at 80 min after the injection of the highest dose.</p>
