

# **Eritoran**

Cat. No.: HY-105070 CAS No.: 185955-34-4 Molecular Formula:  $C_{66}H_{126}N_{2}O_{19}P_{2}$ Molecular Weight: 1313.66

Target: EBV; Toll-like Receptor (TLR)

Pathway: Anti-infection; Immunology/Inflammation

Please store the product under the recommended conditions in the Certificate of Storage:

Analysis.

**Product** Data Sheet

## **BIOLOGICAL ACTIVITY**

Descrip	tion
---------	------

Eritoran ME5564 free base is a Toll-like receptor 4 (TLR4) antagonist. Eritoran protects mice against lethal influenza virus infection, such as Ebola virus (EBOV), Marburg virus (MARV). Eritoran decreases the level of granulocytosis, may alleviate the severity of the "cytokine storm". Eritoran inhibits pathogenesis of filovirus infection. Eritoran has anti-inflammatory activity [1][2]

## IC<sub>50</sub> & Target

#### TLR4

### In Vivo

Eritoran (233 µg/mouse; i.p.; 10 days) protects mouse from EBOV lethal infection, results 70% survived until the end of the study<sup>[1]</sup>.

Eritoran (2 μL of 1.1 mg/mL, corneal infusion) inhibits LPS (HY-D1056) -induced corneal inflammation in mice<sup>[2]</sup>. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model: C57BL/6J mice challenged with lethal EBOV<sup>[1]</sup> Dosage: 233 μg/mouse Administration: Intraperitoneal injection; 10 days Result: Reduced granulocytosis and results in a higher percentage of activated CD11b+ Ly6G/Ly6C+ neutrophils. Dramatically reduced the levels of IFN-y-secreting CD8+ and CD4+ T cells and IL-17Asecreting CD4+ T cells.
