

Enterodiol

Cat. No.:	HY-108695
CAS No.:	80226-00-2
Molecular Formula:	C ₁₈ H ₂₂ O ₄
Molecular Weight:	302.36
Target:	Apoptosis; Endogenous Metabolite
Pathway:	Apoptosis; Metabolic Enzyme/Protease
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	Enterodiol is transformed by human intestinal bacteria from lignans contained in various whole-grain cereals, nuts, legumes, flaxseed, and vegetables. Enterodiol has an apoptotic effect in colorectal cancer (CRC) cells. Anti-cancer activities [1][2].									
IC₅₀ & Target	Human Endogenous Metabolite									
In Vitro	<p>Enterodiol (0-100 μM; 24-72 hours) results in an apoptosis rate of up to 40% in CT26 cells. Enterodiol shows no cytotoxicity toward RAW264.7 macrophages^[1].</p> <p>Enterodiol (0-100 μM; 24-48 hours) also suppresses the migration of CRC cells in a concentration-dependent manner. The phosphorylation of ERK, JNK, and p38 is down-regulated with Enterodiol treatment. Enterodiol (0-100 μM; 48 hours) decreases the expression levels of anti-apoptotic proteins in CRC cells^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>									
In Vivo	<p>Enterodiol (1 mg/kg; intra-tumor injection method; once every other day until day 32) suppresses tumor markedly^[2]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1"> <tr> <td>Animal Model:</td> <td>4-8 weeks old female BALB/c nude mice^[2]</td> </tr> <tr> <td>Dosage:</td> <td>1 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>Intra-tumor injection method; once every other day until day 32</td> </tr> <tr> <td>Result:</td> <td>A significant reduction in the tumor volume in the experimental groups compared to the PBS group.</td> </tr> </table>		Animal Model:	4-8 weeks old female BALB/c nude mice ^[2]	Dosage:	1 mg/kg	Administration:	Intra-tumor injection method; once every other day until day 32	Result:	A significant reduction in the tumor volume in the experimental groups compared to the PBS group.
Animal Model:	4-8 weeks old female BALB/c nude mice ^[2]									
Dosage:	1 mg/kg									
Administration:	Intra-tumor injection method; once every other day until day 32									
Result:	A significant reduction in the tumor volume in the experimental groups compared to the PBS group.
