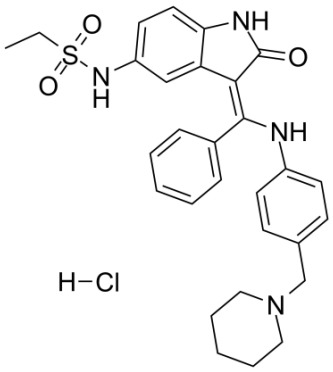
Hesperadin hydrochloride

Cat. No.:	HY-12054A
Molecular Formula:	$C_{29}H_{33}ClN_4O_3S$
Molecular Weight:	553.12
Target:	Aurora Kinase; Autophagy; Influenza Virus; Parasite
Pathway:	Cell Cycle/DNA Damage; Epigenetics; Autophagy; Anti-infection
Storage:	Please store the product under the recommended conditions in the COA.



BIOLOGICAL ACTIVITY

Description	Hesperadin hydrochloride is an ATP competitive indolinone inhibitor of **Aurora A** and **B**. Hesperadin hydrochloride inhibits Aurora B with an **IC_{50}** of 250 nM[1].
IC_{50} & Target	Aurora B 250 nM (IC_{50})
In Vitro	Hesperadin (10-100 nM) inhibits the Aurora kinase-1 (TbAUK1)-mediated phosphoryation of trypanosome histone H3 (TbH3) in a dose dependent manner, with an IC_{50} of 40 nM[1]. Hesperadin (0.01-10 μM; 24 or 48 hours) inhibits growth of bloodstream forms (BF) and procyclic forms (PF) cultures [1]. Hesperadin (100-200 nM; 24-72 hours) alters cell morphology and inhibits cell cycle progression similar to the RNAi knockdown of TbAUK1[1].
In Vivo	Hesperadin (20 mg/kg/d; i.v.) prolongs the survival of xenograft mice via synergistic effect with Temozolomide (TMZ)

Cell Viability Assay[1]

Cell Line:	M110 cells
Concentration:	0.01, 0.1, 1, 10 μM
Incubation Time:	24 hours or 48 hours
Result:	Inhibiting growth of BF cultures with an IC_{50} of 50 nM, while the inhibition of PF growth required approximately 11-fold more Hesperadin, with an IC_{50} of 550 nM.

Cell Cycle Analysis[1]

Cell Line:	M110 cells
Concentration:	100, 200 nM
Incubation Time:	24, 48, 72 hours
Result:	Had a strong effect on cell growth and mitotic progression at 100-200 nM.

[2].

Animal Model:	6-week-old female nude mice injected GBM cells[2]
Dosage:	20 mg/kg/d
Administration:	I.v. injection
Result:	Increased the survival of xenograft mice models.
