Volasertib

Cat. No.: HY-12137
CAS No.: 755038-65-4
Molecular Formula: C₃₄H₅₀N₈O₃
Molecular Weight: 618.81
Target: Polo-like Kinase (PLK)
Pathway: Cell Cycle/DNA Damage
Storage: Powder
-20°C: 3 years
4°C: 2 years
In solvent
-80°C: 6 months
-20°C: 1 month

Solvent & Solubility

In Vitro DMSO: 50 mg/mL (80.80 mM; Need ultrasonic)

Please refer to the solubility information to select the appropriate solvent.

In Vivo

1. Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
   Solubility: ≥ 2.5 mg/mL (4.04 mM); Clear solution

2. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
   Solubility: ≥ 2.5 mg/mL (4.04 mM); Clear solution

3. Add each solvent one by one: 10% DMSO >> 90% corn oil
   Solubility: ≥ 2.5 mg/mL (4.04 mM); Clear solution

BIOLOGICAL ACTIVITY

Description
Volasertib is a highly potent Polo-like kinase 1 (PLK1) inhibitor with an IC₅₀ of 0.87 nM, as well as the two closely related kinases PLK2 and PLK3 with IC₅₀s of 5 and 56 nM, respectively.

IC₅₀ & Target
IC₅₀: 0.87 nM (PLK1), 5 nM (PLK2), 56 nM (PLK3)³

In Vitro
Volasertib is potent against HeLa and Caski cells with IC₅₀ values of 0.02 μM and 2.02 μM, respectively. Volasertib
(0.03 μM) induces cell cycle arrest at G2/M Phase in cervical cancer cells. Volasertib (0.003-0.03 μM) induces apoptosis in HeLa cells, and Volasertib (0.3-3 μM) results in Caski cell apoptosis. Volasertib (1, 3 μM or 0.01,0.03 μM) augments the fluorescent intensity of DHE in Caski and HeLa cells in a dose-dependent manner[1]. Volasertib shows inhibitory activities against the proliferation of all 40 cell lines tested, with a mean half-maximal growth inhibitory concentration of 313 nM (range: 4-5000 nM)[2]. Volasertib inhibits proliferation of multiple cell lines derived from various cancer tissues, including carcinomas of the colon (HCT 116, EC50=23 nM) and lung (NCI-H460, EC50=21 nM), melanoma (BRO, EC50=11 nM), and hematopoietic cancers (GRANTA-519, EC50=15 nM; HL-60, EC50=32 nM; THP-1, EC50=36 nM and Raji, EC50=37 nM) with EC50 values of 11 to 37 nM. Volasertib (100 nM) causes G2-M arrest and induces apoptosis in NCI-H460 cells[3].

### In Vivo

Volasertib (15 mg/kg, i.p.) potentiates the activity of cisplatin to inhibit xenograft tumor growth of cervical cancer cells in nude mice[1]. Volasertib (70 mg/kg, p.o. once a week or 10 mg/kg, p.o. daily) significantly delays tumor growth in a non-small cell lung carcinoma xenograft model. In addition, Volasertib (15 mg/kg, i.v.) markedly suppresses tumor growth and is well tolerated[3].

### PROTOCOL

**Kinase Assay**[3]

Enzyme activity assays for Plk1, Plk2, and Plk3 are done in the presence of serially diluted inhibitor using 20 ng of recombinant kinase and 10 μg casein from bovine milk as substrate. Kinase reactions are done in a final volume of 60 μL for 45 min at 30°C [15 mM MgCl2, 25 mM MOPS (pH 7.0), 1 mM DTT, 1% DMSO, 7.5 μM ATP, 0.3 μCi γ-32P-ATP]. Reactions are terminated by the addition of 125 μL of ice-cold 5% TCA. After transferring the precipitates to MultiScreen mixed ester cellulose filter plates, plates are washed with 1% TCA and quantified radiometrically. Dose-response curves are used for calculating IC50 values. To establish a kinase selectivity profile, additional kinase assays are done by contract research organizations or reagents are purchased from commercial sources and assays are done according to the supplier’s instructions. Appropriate positive and negative controls are included in the assay design. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

**Cell Assay**[1]

Cells are firstly seeded into a 96-well plate at a density of 5000 cells per well, and incubated with drugs in three parallel wells for 72 hr. Then MTT is added to each well at a final concentration of 0.5 mg/mL. After incubation for 4 hr, formazan crystals are dissolved in 100 μL of DMSO, and absorbance at 570 nm is measured by plate reader. The concentrations required to inhibit growth by 50% (IC50) are calculated from survival curves[1]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

**Animal Administration**[3]

Female BomTac: NMRI-Foxn1nu mice are grafted s.c. with 2×106 HCT 116 human colon carcinoma cells (ATCC CCL-247), 1×106 NCI-H460 non-small cell lung cancer cells (ATCC HTB-177), or CXB1 human colon carcinoma tumor pieces derived from patient material by serial transplantation in nude mice. When tumors have reached a volume of appr 50 to 100 mm³, animals are randomized into treatment and control groups of 10 mice each. Volasertib is formulated in hydrochloric acid (0.1 N), diluted with 0.9% NaCl, and injected i.v. into the tail vein at the indicated dose and schedule. For oral treatment, Volasertib is resuspended in 0.5% Natrosol 250 hydroxyethyl-cellulose and given intragastrally via gavage needle. An administration volume of 10 mL per kilogram of body weight is used for both administration routes. Tumor volumes are determined thrice a week using a caliper. The results are converted to tumor volume (mm³) by the formula length×width²×π/6. The weight of the mice is determined as an indicator of tolerability on the same days. Median tumor volumes on the last day of the experiment are used to calculate treated versus control values (= tumor volumetreated mice ×100/tumor volumecontrol mice).

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
