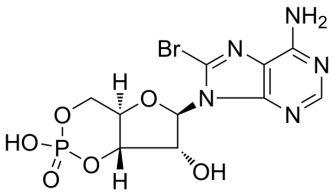
8-Bromo-cAMP

Cat. No.:	HY-12306A
CAS No.:	23583-48-4
Molecular Formula:	$C_{10}H_{11}BrN_5O_6P$
Molecular Weight:	408.1
Target:	PKA; Apoptosis
Pathway:	Stem Cell/Wnt; TGF-beta/Smad; Apoptosis
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.



BIOLOGICAL ACTIVITY

Description	8-Bromo-cAMP (8-Br-Camp), a cyclic AMP analog, is an activator of cyclic AMP-dependent protein kinase (PKA). 8-Bromo-cAMP has anti-proliferative and apoptotic effects against cancer cells[1][2].
IC_{50} & Target	PKA[1]
In Vitro	8-Bromo-cAMP (0.1/0.5 mM) enhances the reprogramming efficiency of human neonatal foreskin fibroblast (HFF1) cells, and 0.1 mM of 8-Bromo-cAMP shows a synergistic effect with Valproic acid (HY-10585) (0.5 mM)[1]. 8-Bromo-cAMP (20 μM, 24 and 48 h) induces apoptosis in esophageal cancer cell line (Eca-109)[2]. 8-Bromo-cAMP (0.5 mM, 2 days) induces decidualization of human endometrial stromal cells[3]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
In Vivo	8-Bromo-cAMP (60 mg/kg/day, i.p., 7 days) reduces tumor in CT26 tumor mice[4]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model:	CT26 tumor mice[4]
Dosage:	60 mg/kg/day
Administration:	i.p., 7 days
Result:	Decreases amounts of primary CRC tumor nodules and liver metastases. Reduces vasculogenic mimicry (PAS–CD31 staining of colorectal and intestinal tumors). Inhibits cAMP and VEGF expression, increases expression of PKA in tumor tissues.
