### BIOLOGICAL ACTIVITY

#### Description

Etoposide (VP-16; VP-16-213) is an anti-cancer chemotherapy agent. Etoposide inhibits topoisomerase II, thus stopping DNA replication. Etoposide induces cell cycle arrest, apoptosis and autophagy<sup>[1]</sup>.

<b>In Vitro</b>	<p>Etoposide is capable of causing cytotoxicity on pancreatic <math>\beta</math>-cells by inducing apoptosis through the JNK/ERK-mediated GSK-3 downstream-triggered mitochondria-dependent signaling pathway in RIN-m5F cells<sup>[1]</sup>.</p> <p>Etoposide and Anti-Human VEGF significantly abolish P1 sphere-forming ability, an effect associated with apoptosis of this subset of cells<sup>[2]</sup>.</p> <p>Etoposide phosphate (0-1<math>\mu</math>M; 72 hours) inhibits HCT116 FBXW<sup>+/+</sup>, FBXW<sup>-/-</sup> and p53<sup>-/-</sup> as a dose-dependent manner, exhibits IC<sub>50</sub>s of 0.945 <math>\mu</math>M; 0.375 <math>\mu</math>M; and 1.437 <math>\mu</math>M, respectively<sup>[5]</sup>.</p> <p>Etoposide (25 <math>\mu</math>M; 6 hours) delays p53 recover in FBXW7-deficient cells.
