

AS-99 free base

Cat. No.:	HY-141429
CAS No.:	2323623-93-2
Molecular Formula:	C ₂₇ H ₃₀ F ₃ N ₅ O ₃ S ₂
Molecular Weight:	593.68
Target:	Histone Methyltransferase; Apoptosis
Pathway:	Epigenetics; Apoptosis
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	AS-99 is a first-in-class, potent and selective ASH1L histone methyltransferase inhibitor (IC ₅₀ = 0.79 μM, K _d = 0.89 μM) with anti-leukemic activity. AS-99 blocks cell proliferation, induces apoptosis and differentiation, downregulates MLL fusion target genes, and reduces the leukemia burden in vivo ^[1] .								
IC₅₀ & Target	0.79 μM (ASH1L histone methyltransferase) ^[1]								
In Vitro	<p>AS-99 is tested against a panel of 20 histone methyltransferases, including NSD1, NSD2, NSD3, and SETD2. NO significant inhibition is observed at 50 μM of AS-99 on any of the tested histone methyltransferases, indicating over 100-fold selectivity towards ASH1L^[1].</p> <p>AS-99 shows a several fold weaker effect on the proliferation of leukemia cells without MLL1 translocations, such as SET2 and K562, with no or limited effects at 10 μM or higher concentrations^[1].</p> <p>AS-99 (1-8 μM; 7 days) also induces apoptosis in the MLL leukemia cells, but not in the K562 cells, as assessed by the quantification of the Annexin V positive cells^[1].</p> <p>AS-99 suppresses MLL fusion driven transcriptional programs^[1].</p> <p>AS-99 results in a reduced number of H3K36me2 peaks when compared to the DMSO-treated cells^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>RT-PCR^[1]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>MOLM13 cells</td> </tr> <tr> <td>Concentration:</td> <td>2-6 μM</td> </tr> <tr> <td>Incubation Time:</td> <td>7 days</td> </tr> <tr> <td>Result:</td> <td>Led to a dose-dependent downregulation of canonical MLL fusion target genes required for leukemogenesis including MEF2C, DLX2, FLT3, and HOXA9.</td> </tr> </table>	Cell Line:	MOLM13 cells	Concentration:	2-6 μM	Incubation Time:	7 days	Result:	Led to a dose-dependent downregulation of canonical MLL fusion target genes required for leukemogenesis including MEF2C, DLX2, FLT3, and HOXA9.
Cell Line:	MOLM13 cells								
Concentration:	2-6 μM								
Incubation Time:	7 days								
Result:	Led to a dose-dependent downregulation of canonical MLL fusion target genes required for leukemogenesis including MEF2C, DLX2, FLT3, and HOXA9.								
In Vivo	<p>AS-99 (30 mg/kg; i.p.; q.d., treated for 14 consecutive days) reduces leukemia burden in mice^[1].</p> <p>AS-99 is used for in vivo studies in mice, which reveals favorable exposure in plasma upon i.v. and i.p. administration (AUC = 9701 hr* ng/mL and 10,699 hr* ng/mL, respectively), suitable half-life (~5-6 h) and C_{max} >10 μM^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>								

Animal Model:	8- to 10-week old female NSG mice (bearing MV4;11 cells) ^[1]
Dosage:	30 mg/kg
Administration:	I.p.; q.d., treated for 14 consecutive days
Result:	Reduced the leukemia burden in the xenotransplantation mouse model of MLL leukemia without affecting blood counts in normal mice.
