

MS67

Cat. No.:	HY-141796
CAS No.:	2407452-77-9
Molecular Formula:	C ₅₂ H ₅₉ F ₄ N ₉ O ₇ S
Molecular Weight:	1030.14
Target:	Histone Methyltransferase; PROTACs
Pathway:	Epigenetics; PROTAC
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	MS67 is a potent and selective WD40 repeat domain protein 5 (WDR5) degrader with a K _d of 63 nM. MS67 is inactive against other protein methyltransferases, kinases, GPCRs, ion channels, and transporters. MS67 shows potent anticancer effects ^[1] .									
IC₅₀ & Target	VHL	WDR5 63 nM (K _d)								
In Vitro	<p>MS67 (0.001-1 μM) induces WDR5 degradation at a concentration as low as 1 nM. MS67 induces WDR5 depletion much more effectively in all six mixed lineage leukemia (MLL)-r acute myeloid leukemia (AML) and four pancreatic ductal adenocarcinoma (PDAC) cell lines without a hook effect and in a concentration-dependent manner in PDAC cells^[1]. MS67 decreases H3K4me2/3 in both MV4;11 and MIA PaCa-2 cells, whereas other examined histone methylation marks such as H3K9me3, H3K27me3, and H3K36me3 are not affected. MS67 is effective in suppressing both WDR5-related gene expression programs and WDR5/MLL-induced H3K4 methylations on chromatin^[1].</p> <p>The GI₅₀ values of MS67 in the two most sensitive AML lines, MV4;11 and EOL-1, are 15 nM and 38 nM, respectively. MLL-r acute leukemia cell lines including MV4;11, EOL-1, MOLM13, KOPN8, RS4;11, and THP-1 are sensitive to MS67, whereas leukemia cell lines that did not harbor MLL-r (including K562, HL60, and a murine AML line transformed by Hoxa9 plus Meis1) are insensitive to MS67^[1].</p> <p>MS67 binds to VCB (VHL-Elongin C-Elongin B ternary complex), with a K_d of 140 nM^[1]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>Western Blot Analysis^[1]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>MV4;11 cells</td> </tr> <tr> <td>Concentration:</td> <td>0.001 μM, 0.005 μM, 0.01 μM, 0.05 μM, 0.1 μM, 0.5 μM, 1 μM</td> </tr> <tr> <td>Incubation Time:</td> <td>18 hours</td> </tr> <tr> <td>Result:</td> <td>Induced WDR5 degradation at a concentration as low as 1 nM with DC₅₀ of 3.7 nM.</td> </tr> </table>		Cell Line:	MV4;11 cells	Concentration:	0.001 μM, 0.005 μM, 0.01 μM, 0.05 μM, 0.1 μM, 0.5 μM, 1 μM	Incubation Time:	18 hours	Result:	Induced WDR5 degradation at a concentration as low as 1 nM with DC ₅₀ of 3.7 nM.
Cell Line:	MV4;11 cells									
Concentration:	0.001 μM, 0.005 μM, 0.01 μM, 0.05 μM, 0.1 μM, 0.5 μM, 1 μM									
Incubation Time:	18 hours									
Result:	Induced WDR5 degradation at a concentration as low as 1 nM with DC ₅₀ of 3.7 nM.									
In Vivo	<p>MS67 (75 mg/kg; i.p.; twice daily; 5 days a week; for 20 days) significantly inhibits tumor growth in vivo and prolongs survival of the treated mice^[1].</p> <p>After a single intraperitoneal (i.p.) injection of MS67 at a dose of 75 mg/kg, the C_{max} reached at about 4.2 μM, and the concentration of MS67 retained above 0.5 μM over 12 hours^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>									

Animal Model:	MV4;11 MLL-r AML xenograft mouse ^[1]
Dosage:	75 mg/kg
Administration:	i.p.; twice daily; 5 days a week; for 20 days
Result:	Inhibited tumor growth in vivo.
