Fadrozole hydrochloride

Cat. No.: HY-14247

CAS No.: 102676-31-3

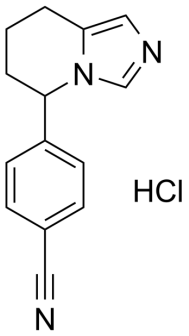
Molecular Formula: $C_{14}H_{14}ClN_3$

Molecular Weight: 259.73

Target: Aromatase

Pathway: Others

Storage: 4°C, sealed storage, away from moisture
* In solvent : -80°C, 6 months; -20°C, 1 month (sealed storage, away from moisture)



SOLVENT & SOLUBILITY

In Vitro

DMSO : 100 mg/mL (385.02 mM; Need ultrasonic and warming)
H_2O : 100 mg/mL (385.02 mM; Need ultrasonic)

Preparing Stock Solutions

Solvent / Mass / Concentration	1 mg	5 mg	10 mg
1 mM	3.8502 mL	19.2508 mL	38.5015 mL
5 mM	0.7700 mL	3.8502 mL	7.7003 mL
10 mM	0.3850 mL	1.9251 mL	3.8502 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

1. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
   Solubility: ≥ 2.08 mg/mL (8.01 mM); Clear solution
2. Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
   Solubility: ≥ 2.08 mg/mL (8.01 mM); Clear solution
3. Add each solvent one by one: 10% DMSO >> 90% corn oil
   Solubility: ≥ 2.08 mg/mL (8.01 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

Fadrozole hydrochloride (CGS 16949A) is a potent, selective and nonsteroidal inhibitor of aromatase with an IC_{50} of 6.4 nM.

IC_{50} & Target

IC50: 6.4 nM (aromatase)[1]

In Vitro

Fadrozole hydrochloride is a potent, selective and nonsteroidal inhibitor of aromatase with an IC_{50} of 6.4 nM. In hamster ovarian slices, Fadrozole hydrochloride inhibits the production of estrogen with an IC_{50} of 0.03 μM. The production of progesterone is inhibited with an IC_{50} of 120 μM. Synthesis of other cytochrome P-450 dependent steroids can be suppressed to various degrees with higher doses of Fadrozole hydrochloride[1].

	MCE has not independently confirmed the accuracy of these methods. They are for reference only.
In Vivo	Fadrozole hydrochloride is able to inhibit the aromatase-mediated uterine hypertrophy in immature female rats with an ED_{50} of 0.03 mg/kg when given orally. In the same model, aminoglutethimide elicits the same effect with an ED_{50} of 30 mg/kg when given orally[1]. Fadrozole hydrochloride prevents the development of both benign and malignant spontaneus mammary neoplasns in female Sprague-Dawley rats. It also slows the spontaneous development of ptuitary pars distalis adenomas in female rats, and reduces the incidence of spontaneous hepatocellular tumours in male and female rats[2]. Administration of Fadrozole hydrochloride in male and female mice accompanies with a 70% reduction in parasite burden. This protective effect is associated in male mice with a recovery of the specific cellular immune response. Interleukin-6 (IL-6) serum levels, and its production by splenocytes, is augmented by 80%, together with a 10-fold increase in its expression in testes of infected male mice. Fadrozole hydrochloride treatment returns these levels to baseline values[3]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Animal Administration [2][3]	Rats: Rats are treated with daily dosing with Fadrozole hydrochloride in purified water by gavage for 2 years. There are 60 rats in each of four groups given 0, 0.05, 0.25 or 1.25 mg/kg daily. Control rats receive only water. Clinical signs are recorded weekly and the animals are examined for palpable masses every 4 weeks for the first 9 months, then every 2 weeks for the remainder of the study[2]. Mice: Fadrozole hydrochloride is administered in the form of sub-dermal long-term release pellets (20 mg/wt kg, in three-week-release pellets), starting 1 week prior to the infection, using a 10-gauge needle. Three pellets are administrated during the study. Placebo pellets are administered to another group of infected mice, in the same fashion as the inhibitor. After 1 week, mice are infected and killed 8 weeks later[3]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
