

## Indomethacin

Cat. No.:	HY-14397
CAS No.:	53-86-1
Molecular Formula:	C <sub>19</sub> H <sub>16</sub> ClNO <sub>4</sub>
Molecular Weight:	357.79
Target:	COX; Antibiotic; Influenza Virus; Bacterial
Pathway:	Immunology/Inflammation; Anti-infection
Storage:	4°C, protect from light * In solvent : -80°C, 1 year; -20°C, 6 months (protect from light)

### SOLVENT & SOLUBILITY

#### In Vitro

DMSO : 100 mg/mL (279.49 mM; Need ultrasonic)  
Ethanol : 12.5 mg/mL (34.94 mM; Need ultrasonic)  
H<sub>2</sub>O : < 0.1 mg/mL (insoluble)

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	2.7949 mL	13.9747 mL	27.9494 mL
	5 mM	0.5590 mL	2.7949 mL	5.5899 mL
	10 mM	0.2795 mL	1.3975 mL	2.7949 mL

Please refer to the solubility information to select the appropriate solvent.

#### In Vivo

- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline  
Solubility: ≥ 2.08 mg/mL (5.81 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)  
Solubility: ≥ 2.08 mg/mL (5.81 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil  
Solubility: ≥ 2.08 mg/mL (5.81 mM); Clear solution
- Add each solvent one by one: 10% EtOH >> 40% PEG300 >> 5% Tween-80 >> 45% saline  
Solubility: ≥ 1.25 mg/mL (3.49 mM); Clear solution
- Add each solvent one by one: 10% EtOH >> 90% (20% SBE-β-CD in saline)  
Solubility: ≥ 1.25 mg/mL (3.49 mM); Clear solution
- Add each solvent one by one: 10% EtOH >> 90% corn oil  
Solubility: ≥ 1.25 mg/mL (3.49 mM); Clear solution

### BIOLOGICAL ACTIVITY

<b>Description</b>	Indomethacin (Indometacin) is a potent, orally active COX1/2 inhibitor with IC <sub>50</sub> values of 18 nM and 26 nM for COX-1 and COX-2, respectively. Indomethacin has anticancer activity and anti-infective activity. Indomethacin can be used for cancer, inflammation and viral infection research <sup>[1][2][3]</sup> .																	
<b>IC<sub>50</sub> &amp; Target</b>	Human COX-1 18 nM (IC <sub>50</sub> , in CHO cells)	Human COX-2 26 nM (IC <sub>50</sub> , in CHO cells)																
<b>In Vitro</b>	<p>Indomethacin (Indometacin) (0-150 μM; 24 hours; 3LL-D122 cells) has anticancer activity in vitro<sup>[2]</sup>. Indomethacin (Indometacin) (0-1000 μM) protects the host cells from damage caused by the virus through activates PKR, resulting in eIF2α phosphorylation, and in turn shutting of translation of viral protein and inhibiting replication of the virus (IC<sub>50</sub>=2μM)<sup>[3]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>Cell Viability Assay<sup>[2]</sup></p> <table border="1" data-bbox="367 594 1513 825"> <tr> <td>Cell Line:</td> <td>3LL-D122 cells (highly metastatic variant of mouse LLCarcinoma cells)</td> </tr> <tr> <td>Concentration:</td> <td>0, 20, 50, 100 and 150μM</td> </tr> <tr> <td>Incubation Time:</td> <td>24 hours</td> </tr> <tr> <td>Result:</td> <td>Inhibited cell viability at 20 mM, with 50% inhibition at 60 mM.</td> </tr> </table> <p>Cell Viability Assay<sup>[2]</sup></p> <table border="1" data-bbox="367 898 1513 1163"> <tr> <td>Cell Line:</td> <td>3LL-D122 cells (highly metastatic variant of mouse LLCarcinoma cells)</td> </tr> <tr> <td>Concentration:</td> <td>0, 30 and 80μM</td> </tr> <tr> <td>Incubation Time:</td> <td>24 hours</td> </tr> <tr> <td>Result:</td> <td>Decreased in the percentage of cells at the G2/M phase and increased in the percentage of cells at G1 phase.</td> </tr> </table>		Cell Line:	3LL-D122 cells (highly metastatic variant of mouse LLCarcinoma cells)	Concentration:	0, 20, 50, 100 and 150μM	Incubation Time:	24 hours	Result:	Inhibited cell viability at 20 mM, with 50% inhibition at 60 mM.	Cell Line:	3LL-D122 cells (highly metastatic variant of mouse LLCarcinoma cells)	Concentration:	0, 30 and 80μM	Incubation Time:	24 hours	Result:	Decreased in the percentage of cells at the G2/M phase and increased in the percentage of cells at G1 phase.
Cell Line:	3LL-D122 cells (highly metastatic variant of mouse LLCarcinoma cells)																	
Concentration:	0, 20, 50, 100 and 150μM																	
Incubation Time:	24 hours																	
Result:	Inhibited cell viability at 20 mM, with 50% inhibition at 60 mM.																	
Cell Line:	3LL-D122 cells (highly metastatic variant of mouse LLCarcinoma cells)																	
Concentration:	0, 30 and 80μM																	
Incubation Time:	24 hours																	
Result:	Decreased in the percentage of cells at the G2/M phase and increased in the percentage of cells at G1 phase.																	
<b>In Vivo</b>	<p>Following oral administration of indomethacin, drug absorption is rapid and complete, but there are important inter- and intra-individual differences. In general, peak plasma concentrations of 2-3 μg/mL are achieved within 1-2 h, but concurrent ingestion of food will reduce and delay peak concentrations without reducing absorption. In plasma, 90% of indomethacin is bound to albumin at therapeutic plasma concentrations<sup>[4]</sup>.</p> <p>Indomethacin can be used in animal modeling to construct gastric ulcer models.</p> <div data-bbox="367 1472 1513 1556" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p>Induction of gastric ulceration<sup>[5][6]</sup></p> </div> <ul style="list-style-type: none"> <li data-bbox="391 1591 1513 1801"> <span style="color: #e67e22;">●</span> Background           <div style="border-left: 1px solid #ccc; border-right: 1px solid #ccc; border-bottom: 1px solid #ccc; padding: 5px; margin-left: 20px;">             Indomethacin can cause gastric ulceration by various mechanisms, including injury through inhibition of prostaglandin (PG) synthesis, reduction in local blood flow, regional irritation, and inhibition of tissue regeneration.           </div> </li> <li data-bbox="391 1833 1513 1875"> <span style="color: #e67e22;">●</span> Specific Modeling Methods           <div style="border-left: 1px solid #ccc; border-right: 1px solid #ccc; border-bottom: 1px solid #ccc; padding: 5px; margin-left: 20px;"> </div> </li> </ul>																	

Rats: albino Sprague-Dawley • male • adult (period: 2 weeks)

Administration: 100 mg/kg • p.o. • single dose

#### Note

- (1) All animals fasted 24 h before drug administration.
- (2) Indomethacin were dissolved in saline with 5% NaOH.

#### Modeling Indicators

Gastric tissue macroscopic alterations: Showed prominent mucosal folds and severe erosion, pronounced ulceration and bleeding foci in the gastric mucosa.

Histopathological changes: Showed severe erosion of the mucosa, reaching down to the lamina muscularis; observed hemorrhagic infiltration, edema in the submucosa, and severe hyperemia of the vessels.

Molecular changes: Showed intense Tnf- $\alpha$  expression.

Biochemical changes: Increased MDA, TOS levels, reduced TAS levels, CAT and GPx activities and GSH levels.

- Correlated Product(s): Indomethacin sodium hydrate (HY-14397A)
- Opposite Product(s): Carnosic acid (HY-N0644)

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model:	Male Sprague-Dawley rats <sup>[1]</sup>
Dosage:	0.01-10 mg/kg
Administration:	Oral administration; for 3 hours
Result:	Inhibited the carrageenan-induced rat paw oedema (ED <sub>50</sub> =2.0 mg/kg) and hyperalgesia (ED <sub>50</sub> =1.5 mg/kg) in a dose-dependent manner.

Animal Model:	Male C57BL/6J mice <sup>[2]</sup>
Dosage:	10 mg/mL
Administration:	Oral administration; daily, for 29 days
Result:	Delayed the onset of tumor growth and the initial growth rate of the footpad tumors.
