BIOLOGICAL ACTIVITY

Description

Ziprasidone (CP-88059), an orally active antipsychotic agent, is a combined 5-HT and dopamine receptor antagonist[1].
Ziprasidone mesylate trihydrate has affinities for Rat D_2 (K_i=4.8 nM), 5-HT_{2A} (K_i=0.42 nM) and 5-HT_{1A} (K_i=3.4 nM)[1].

IC_{50} & Target

Rat 5-HT_{1A} Receptor	Rat D_2 Receptor	Rat 5-HT_{2A}
3.4 nM (Ki)	4.8 nM (Ki)	0.42 nM (Ki)

In Vitro

Ziprasidone (0-500 nM, 150 seconds) blocks wild-type hERG current[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Cell Viability Assay[2]

Cell Line:	HEK-293 cells
Concentration:	0-500 nM
Incubation Time:	150 seconds
Result:	Blocked wild-type hERG current in a voltage- and concentration-dependent manner (IC_{50} = 120 nm).

In Vivo

Ziprasidone (oral gavage; 20 mg/kg; once daily; 7 weeks) results in weight loss, low level physical activity, high resting energy expenditure and greater capacity for thermogenesis when subjected to cold[3].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model:	Eight-week-old female Sprague-Dawley rats weighing 200 to 250 g[3]
Dosage:	20 mg/kg
Administration:	Oral gavage; 20 mg/kg; once daily; 7 weeks
Result:	Gained significantly less weight (P = 0.031), had a lower level of physical activity (P = 0.016), showed a higher resting energy expenditure (P < 0.001), and displayed a greater capacity for thermogenesis when subjected to cold (P < 0.001).
