

GSK 650394

Cat. No.:	HY-15192		
CAS No.:	890842-28-1		
Molecular Formula:	C ₂₅ H ₂₂ N ₂ O ₂		
Molecular Weight:	382.45		
Target:	SGK; Influenza Virus		
Pathway:	Metabolic Enzyme/Protease; Anti-infection		
Storage:	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	6 months
		-20°C	1 month

SOLVENT & SOLUBILITY

In Vitro

DMSO : ≥ 40.7 mg/mL (106.42 mM)
 * "≥" means soluble, but saturation unknown.

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	2.6147 mL	13.0736 mL	26.1472 mL
	5 mM	0.5229 mL	2.6147 mL	5.2294 mL
	10 mM	0.2615 mL	1.3074 mL	2.6147 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
 Solubility: 2.5 mg/mL (6.54 mM); Suspended solution; Need ultrasonic
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
 Solubility: ≥ 2.5 mg/mL (6.54 mM); Suspended solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil
 Solubility: ≥ 2.5 mg/mL (6.54 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

GSK 650394 is a novel SGK inhibitor with IC₅₀ of 62 nM and 103 nM for SGK1 and SGK2 in the SPA assay respectively. GSK 650394 also inhibits influenza virus replication.

IC₅₀ & Target

IC₅₀: 62 nM (SGK1), 103 nM (SGK2)

In Vitro

GSK650394 is relatively non-toxic, with LC₅₀ values of 41 μM in M1 cells (68 times its activity IC₅₀) and a LC₅₀ greater than 100

μM in HeLa cells. GSK650394 inhibits SGK1-mediated epithelial transport with an IC_{50} of $0.6 \mu\text{M}$ in the SCC assay. GSK650394 inhibits the growth of LNCaP cells with IC_{50} of approximately $1 \mu\text{M}$ ^[1]. GSK650394A inhibits the insulin-induced phosphorylation of PKB-Ser⁴⁷³ at $3 \mu\text{M}$, and essentially abolishes this response at $10 \mu\text{M}$. GSK650394A ($1\text{-}10 \mu\text{M}$) does not alter the phosphorylation of PRAS40-Ser246 in hormone-deprived cells or prevent the insulin-induced phosphorylation of this residue^[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

In Vivo

GSK650394 ($1, 10, \text{ and } 30 \mu\text{M}$, $10 \mu\text{L}/\text{rat}$, intrathecally) dose-dependently prevents CFA-induced pain behavior and the associated SGK1 phosphorylation, GluR1 trafficking, and protein-protein interactions at 1 day after CFA administration^[3]. GSK650394 at concentrations of $10, 30, \text{ and } 100 \text{ nM}$ ($10 \mu\text{L}$), but not vehicle solution (SNL 3D+Veh and SNL 7D+Veh, respectively), dose-dependently increases the withdrawal latency of the ipsilateral hindpaw at 1-3 and 1-5 h after injection at days 3 and 7 postsurgery (SNL 3D+GSK and SNL 7D+GSK, respectively). GSK650394 (from day 0 to 6 postsurgery; 100 nM , $10 \mu\text{L}$, i.t.) administration alleviates SNL-induced allodynia at days 3, 5, and 7 postsurgery in SNL animals^[4].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Cell Assay ^[1]

The toxicity of GSK650394 to M-1 and HeLa cells is assessed using the Cell Proliferation Kit (XTT) following manufacturer's instructions. Briefly, $10,000$ HeLa or M-1 cells/well are plated into 96-well plates in $100 \mu\text{L}$ of the appropriate maintenance media. After 48 h, media is removed and replaced with $100 \mu\text{L}$ of EMEM with Earle's salts containing 2 mM L-glutamine and 1% antibiotic-antimycotic overnight. M-1 cells are also supplemented with $1 \mu\text{g}/\text{mL}$ insulin, $6.25 \mu\text{g}/\text{mL}$ sodium selenite, and $6.25 \mu\text{g}/\text{mL}$ transferrin. After 24 h, the media is removed and replaced with $100 \mu\text{L}$ media alone or media containing increasing concentrations of GSK650394. For HeLa cells, $50 \mu\text{L}$ of activated XTT solution is added after 4 h. For M-1 cells, $50 \mu\text{L}$ of activated XTT solution is added after 24 h. Following a 2 h incubation, absorbance is measured at 490 nm using a SpectraMAX PLUS spectrophotometer and the data analyzed to obtain IC_{50} values using GraphPad Prism 3 software. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Administration ^[4]

Briefly, the rats are anesthetized under isoflurane anesthesia (induction 5% , maintenance 2% in oxygen). An incision is made, and the left L5 spinal nerves are carefully isolated and tightly ligated with 6-0 silk sutures $2\text{-}5 \text{ mm}$ distal to the dorsal root ganglia. GSK650394 ($10, 30, \text{ and } 100 \text{ nM}$, $10 \mu\text{L}$) is administered by bolus injection at 3 or 7 d or by daily injection for 7 d (day 0-6) postspinal nerve ligation. A vehicle solution of a volume identical to that of the tested agents is dispensed to serve as a control.

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
