

CP-640186 hydrochloride

Cat. No.:	HY-15259A
CAS No.:	591778-70-0
Molecular Formula:	C ₃₀ H ₃₆ ClN ₃ O ₃
Molecular Weight:	522.08
Target:	Acetyl-CoA Carboxylase
Pathway:	Metabolic Enzyme/Protease
Storage:	4°C, sealed storage, away from moisture * In solvent : -80°C, 2 years; -20°C, 1 year (sealed storage, away from moisture)

HCl

SOLVENT & SOLUBILITY

In Vitro

H₂O : 50 mg/mL (95.77 mM; Need ultrasonic)
 DMSO : ≥ 48 mg/mL (91.94 mM)
 * "≥" means soluble, but saturation unknown.

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	1.9154 mL	9.5771 mL	19.1542 mL
	5 mM	0.3831 mL	1.9154 mL	3.8308 mL
	10 mM	0.1915 mL	0.9577 mL	1.9154 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

- Add each solvent one by one: PBS
Solubility: 100 mg/mL (191.54 mM); Clear solution; Need ultrasonic
- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
Solubility: ≥ 2.5 mg/mL (4.79 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
Solubility: ≥ 2.5 mg/mL (4.79 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil
Solubility: ≥ 2.5 mg/mL (4.79 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

CP-640186 hydrochloride is an orally active and cell-permeable Acetyl-CoA carboxylase (ACC) inhibitor with IC₅₀s of 53 nM and 61 nM for rat liver ACC1 and rat skeletal muscle ACC2 respectively. Acetyl-CoA carboxylase (ACC) is a key enzyme of fatty acid metabolism that enables the synthesis of malonyl-CoA. CP-640186 hydrochloride can also stimulate muscle fatty acid oxidation^{[1][2]}.

IC₅₀ & Target	IC50: 53 nM (rat liver ACC1) and 61 nM (rat skeletal muscle ACC2) ^[1]

Cell Line:	HepG2 cells	Concentration:	0.62-1.8 μM	Incubation Time:	6 hours	Result:	Inhibited fatty acid synthesis and TG synthesis in HepG2 cells with EC ₅₀ s of 0.62 μM and 1.8 μM, respectively.
Cell Line:	Human fibroblasts and H460 cells																								
Concentration:	20 μM																								
Incubation Time:	48 hours																								
Result:	Led to a ~30% decrease in cell number compared to vehicle-treated controls.																								
Cell Line:	C2C12 cells and muscle strips																								
Concentration:	0.1 nM-100 μM																								
Incubation Time:	2 hours																								
Result:	Stimulated palmitate acid oxidation with an EC ₅₀ of 57 nM and a maximal stimulation of 280% in C2C12 cells. Stimulated palmitate acid oxidation with an EC ₅₀ of 1.3 μM and a maximal stimulation of 240% in isolated rat epitrochlearis muscle.																								
Cell Line:	HepG2 cells																								
Concentration:	0.62-1.8 μM																								
Incubation Time:	6 hours																								
Result:	Inhibited fatty acid synthesis and TG synthesis in HepG2 cells with EC ₅₀ s of 0.62 μM and 1.8 μM, respectively.																								
In Vivo	<p>CP-640186 (oral gavage; 4.6-21 mg/kg; once) demonstrates acute efficacy^[1].</p> <p>CP-640186 (intravenous injection and oral gavage; Intravenous dose, 5 mg/kg; oral dose, 10 mg/kg; once) shows low drug exposure in the rat than the ob/ob mouse at equal doses^[1].</p> <p>CP-640186 (oral gavage; 100 mg/kg; once) treatment shows a complete shift from carbohydrate utilization to fatty acid utilization as a source of energy at high exposure level^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1" data-bbox="345 1661 1515 1934"> <tr> <td>Animal Model:</td> <td>Male ob/ob mice^[1]</td> </tr> <tr> <td>Dosage:</td> <td>4.6-21 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>Oral gavage; 4.6-21 mg/kg; once</td> </tr> <tr> <td>Result:</td> <td>Demonstrated acute efficacy for up to 8 h after oral administration, exhibiting ED₅₀ values of 4.6, 9.7, and 21 mg/kg, at 1, 4, and 8 h, respectively, after treatment.</td> </tr> </table>	Animal Model:	Male ob/ob mice ^[1]	Dosage:	4.6-21 mg/kg	Administration:	Oral gavage; 4.6-21 mg/kg; once	Result:	Demonstrated acute efficacy for up to 8 h after oral administration, exhibiting ED ₅₀ values of 4.6, 9.7, and 21 mg/kg, at 1, 4, and 8 h, respectively, after treatment.																
Animal Model:	Male ob/ob mice ^[1]																								
Dosage:	4.6-21 mg/kg																								
Administration:	Oral gavage; 4.6-21 mg/kg; once																								
Result:	Demonstrated acute efficacy for up to 8 h after oral administration, exhibiting ED ₅₀ values of 4.6, 9.7, and 21 mg/kg, at 1, 4, and 8 h, respectively, after treatment.																								

Animal Model:	Male Sprague-Dawley rats ^[1]
Dosage:	Intravenous dose, 5 mg/kg; oral dose, 10 mg/kg
Administration:	Intravenous injection and oral gavage; intravenous dose, 5 mg/kg; oral dose, 10 mg/kg; once
Result:	Showed a plasma half-life of 1.5 h, a bioavailability of 39%, a Cl_p of 65 ml/min/kg, a V_{dss} of 5 liters/kg, an oral T_{max} of 1.0 h, an oral C_{max} of 345 ng/mL, and an oral $AUC_{0-\infty}$ of 960 ng·h/mL.
Animal Model:	Male ob/ob mice ^[1]
Dosage:	Intravenous dose, 5 mg/kg; oral dose, 10 mg/kg
Administration:	Intravenous injection and oral gavage; Intravenous dose, 5 mg/kg; oral dose, 10 mg/kg; once
Result:	Showed a plasma half-life of 1.1 h, a bioavailability of 50%, a Cl_p of 54 ml/min/kg, an oral T_{max} of 0.25 h, an oral C_{max} of 2177 ng/mL, and an oral $AUC_{0-\infty}$ of 3068 ng·h/mL.
Animal Model:	Twenty male Sprague-Dawley rats (350-400 g) fasted and then refed a high sucrose diet for 2 days; additional eight rats fasted for 24 h ^[1]
Dosage:	100 mg/kg
Administration:	Oral gavage; 100 mg/kg; once
Result:	Resulted in time-dependent reductions in RQ (a ratio of CO ₂ production to O ₂ consumption) of up to 64%.
