

JTV-519

Cat. No.:	HY-15293
CAS No.:	1038410-88-6
Molecular Formula:	C ₂₅ H ₃₃ ClN ₂ O ₂ S
Molecular Weight:	461.06
Target:	Calcium Channel
Pathway:	Membrane Transporter/Ion Channel; Neuronal Signaling
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	JTV-519 (K201) is a Ca ²⁺ -dependent blocker of sarcoplasmic reticulum Ca ²⁺ -stimulated ATPase (SERCA) and a partial agonist of ryanodine receptors in striated muscle. Antiarrhythmic and cardioprotective properties ^{[1][2]} .
In Vitro	JTV-519 (K201) inhibits inward Ca ²⁺ movement into large unilamellar vesicles (LUV) caused by annexin V in a dose-dependent manner. In the presence of 50 nM annexin V and 400 μM Ca ²⁺ , 3 μM JTV-519 shows significant inhibition of Ca ²⁺ movement due to annexin V, and 50% inhibition is achieved at 25 μM K201 ^[2] . MCE has not independently confirmed the accuracy of these methods. They are for reference only.
In Vivo	JTV-519 (0.5mg/kg/h, i.v., 2 h before the surgery) improves cardiac function in CLP mice, where the fractional shortening (FS) and ejection fraction (EF) are significantly increased as compared with CLP mice without JTV-519 treatment ^[3] . MCE has not independently confirmed the accuracy of these methods. They are for reference only.
Animal Model:	Wild type male C57BL/6 mice weighing 18-22g with polymicrobial sepsis produced by cecal ligation and puncture (CLP) ^[3]
Dosage:	0.5 mg/kg/h
Administration:	Applied intraperitoneally 2 h before the surgery
Result:	Improved cardiac function, where the EF and FS were significantly increased.
