**SAR131675**

**Cat. No.:** HY-15458  
**CAS No.:** 1433953-83-3  
**Molecular Formula:** C₁₈H₂₂N₄O₄  
**Molecular Weight:** 358.39  
**Target:** VEGFR  
**Pathway:** Protein Tyrosine Kinase/RTK  
**Storage:**  
- Powder: -20°C 3 years, 4°C 2 years  
- In solvent: -80°C 6 months, -20°C 1 month

**SOLVENT & SOLUBILITY**

**In Vitro**  
DMSO: 100 mg/mL (279.03 mM; ultrasonic and warming and heat to 60°C)

Please refer to the solubility information to select the appropriate solvent.

**In Vivo**  
1. Add each solvent one by one: 0.5% CMC-Na/saline water  
   Solubility: 10 mg/mL (27.90 mM); Suspended solution; Need ultrasonic  
2. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline  
   Solubility: ≥ 1.43 mg/mL (3.99 mM); Clear solution  
3. Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)  
   Solubility: ≥ 1.43 mg/mL (3.99 mM); Clear solution  
4. Add each solvent one by one: 10% DMSO >> 90% corn oil  
   Solubility: ≥ 1.43 mg/mL (3.99 mM); Clear solution

**BIOLOGICAL ACTIVITY**

**Description**  
SAR131675 is a potent and selective VEGFR3 inhibitor with an IC₅₀ of 23 nM.

**IC₅₀ & Target**  
IC₅₀: 23 nM (IC₅₀)
**In Vitro**

AR131675 is highly selective for VEGFR-3. However, it is moderately active on VEGFR-2 with a VEGFR-3/VEGFR-2 ratio of about 10. SAR131675 inhibits VEGFR-3 tyrosine kinase activity and VEGFR-3 autophosphorylation in HEK cells with IC\textsubscript{50} values of 20 and 45 nM, respectively. SAR131675 dose dependently inhibits the proliferation of primary human lymphatic cells, induced by the VEGFR-3 ligands VEGFC and VEGFD, with an IC\textsubscript{50} of about 20 nM. SSAR131675 has no antiproliferative activity on a panel of 30 tumors and primary cells, further showing its high specificity and indicating that SAR131675 is not a cytotoxic or cytostatic agent\textsuperscript{[1]}. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

**In Vivo**

SAR131675 is very well tolerated in mice and shows a potent antitumoral effect in several orthotopic and syngenic models, including mammary 4T1 carcinoma and RIP1.Tag2 tumors. Interestingly, it significantly reduces lymph node invasion and lung metastasis, showing its antilymphangiogenic activity in vivo. SAR131675 significantly reduces TAM infiltration and aggregation in 4T1 tumors\textsuperscript{[1]}. Despite the promising findings, SAR131675 development was terminated during preclinical development due to adverse metabolic effects\textsuperscript{[2]}. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

**Protocol**

**Kinase Assay\textsuperscript{[1]}**

Multiwell plates are precoated with a synthetic polymer substrate poly-Glu-Tyr (polyGT 4:1). The reaction is carried out in the presence of kinase buffer (10×: 50 mM HEPES buffer, pH 7.4, 20 mM MgCl\textsubscript{2}, 0.1 mM MnCl\textsubscript{2}, and 0.2 mM Na\textsubscript{3}VO\textsubscript{4}) supplemented with ATP and dimethyl sulfoxide (DMSO) for the positive control (C+) or SAR131675 (ranging from 3-1,000 nM). ATP is used at 30 μM for VEGFR-1 and VEGFR-3 and at 15 μM for VEGFR-2. The phosphorylated poly-GT is probed with a phosphotyrosine specific monoclonal antibody (mAb) conjugated to horseradish peroxidase and developed in the dark with the HRP chromogenic substrate (OPD). The reaction is then stopped by the addition of 100 μL 1.25 mol/L H\textsubscript{2}SO\textsubscript{4}, and absorbance is determined using an Envision spectrophotometer at 492 nm\textsuperscript{[1]}. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

**Cell Assay\textsuperscript{[1]}**

HLMVECs are seeded in 96-well plates coated with 0.3% gelatin (5000 cells per well). Cells are incubated in RPMI 0.1% FCS with VEGFA (10 ng/mL) VEGFC (300 ng/mL), VEGFD (300 ng/mL), or FGF2 (10 ng/mL) in the absence or presence of SAR131675. Five days later, viable cells are quantified with the cell Titer-glo luminescent cell viability assay\textsuperscript{[1]}. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

**Animal Administration\textsuperscript{[1]}**

Mouse: Sterile sponge disks impregnated with 200 μg of FGF2 or PBS are subcutaneously introduced on the back of anaesthetized mice. FGF2 is reinjected into the sponges the first 2 days. Daily oral treatment with SAR131675 (30, 100, and 300 mg/kg/d) started the day of sponge implantation. Seven days later, the animals are euthanatized and the sponges are removed, harvested, and lysed in RIPA buffer at 4°C. After a centrifugation at 6,000 × g, the supernatants are collected for further analysis\textsuperscript{[1]}. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
