### BIOLOGICAL ACTIVITY

Description	Itraconazole (R51211) is a triazole antifungal agent and a potent and orally active Hedgehog (Hh) signaling pathway antagonist with an IC <sub>50</sub> of ~800 nM. Itraconazole potently inhibits lanosterol 14α-demethylase (cytochrome P450 enzyme), thereby inhibits the oxidative conversion of lanosterol to ergosterol. Itraconazole has anticancer and antiangiogenic effects [1][2][3].

<b>In Vitro</b>	<p>Itraconazole has anti-proliferation of HUVEC (IC<sub>50</sub> of 0.16 μM)<sup>[2]</sup>.  Itraconazole inhibits endothelial cell cycle progression at the G1 phase in vitro<sup>[1]</sup>.  MCE has not independently confirmed the accuracy of these methods. <b>In Vivo</b>	<p>Itraconazole (75-100 mg/kg; oral gavage; twice per day; for 18 days; female outbred athymic nude mice) treatment suppresses Hh pathway activity and the growth of medulloblastoma in a mouse allograft model<sup>[1]</sup>.
