Nonivamide

Cat. No.: HY-17568  
CAS No.: 2444-46-4  
Molecular Formula: C₁₇H₂₇NO₃  
Molecular Weight: 293.4  
Target: TRP Channel  
Pathway: Membrane Transporter/Ion Channel; Neuronal Signaling  
Storage:

Please refer to the solubility information to select the appropriate solvent.

In Vivo

1. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline  
   Solubility: ≥ 2.5 mg/mL (8.52 mM); Clear solution

2. Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)  
   Solubility: ≥ 2.5 mg/mL (8.52 mM); Clear solution

3. Add each solvent one by one: 10% DMSO >> 90% corn oil  
   Solubility: ≥ 2.5 mg/mL (8.52 mM); Clear solution

BIOLOGICAL ACTIVITY

Description  
Nonivamide is a agonist, which exhibits 4d-EC₅₀ value of 5.1 mg/L in static toxicity tests.

IC₅₀ & Target  
TRPV1[^1]

In Vitro  
Nonivamide, a synthetic derivate of natural capsaicin, has an effective antifouling activity. Capsaicin exhibits 4d-EC₅₀ values of 5.5±0.5 mg/L, 23±2 mg/L, 6.9±0.2 mg/L, and 15.6±0.4 mg/L in static toxicity tests conducted using
Pseudomonas putida, Lake Erie bacteria, Vibrio natriegens, and Vibrio parahaemolyticus, respectively. A significant growth inhibitory effect (p<0.01) is observed in the group treated with 1 mg/L of Nonivamide for 4 d, and the EC$_{50}$ value (4 d-EC$_{50}$) is 5.1 mg/L$[^1]$. Nonivamide treatment causes calcium release from the ER and altered the transcription of growth arrest- and DNA damage-inducible transcript 3 (GADD153), GADD45α, GRP78/BiP, ATF3, CCND1, and CCNG2) in a manner comparable with prototypical ER stress-inducing agents. ER calcium flux is evaluated by pretreating cells with 2.5 µM thapsigargin for 5 min followed by addition of 2.5 µM Nonivamide. Treatment of TRPV1-overexpressing cells with 2.5 µM Nonivamide produces marked increases in cytosolic calcium due to release of calcium from ER stores. Treatment of TRPV1-overexpressing cells with 1 µM Nonivamide causes an approximate 50% loss in cell viability after a 24-h period. BEAS-2B cells treated with 100 and 200 µM Nonivamide also exhibits a shift in the relative amount of EIF2α-P and an increase in the expression of GADD153 mRNA and protein$[^2]$. Treatment with Nonivamide reduces lipid accumulation to a similar extent as CAP; the effects are not different from the effects after CAP treatment at any of the tested concentrations. Compared to untreated control cells, treatment with Nonivamide decreases lipid accumulation by 5.34±1.03% (P<0.05) at 0.01 µM up to 10.4±2.47% (P<0.001) at 1 µM$[^3]$. 

**PROTOCOL**

**Cell Assay**$[^3]$

In the MTT assay, the reduction of yellow tetrazolium salt MTT to a purple formazan by mitochondrial and ER enzymes is used as a measure for cell viability. Cells are seeded in 96-well plates and treated with 1 nM-10 µM CAP or Nonivamide with or without addition of 25-100 µM BCH or the corresponding ethanol concentration (0.1-0.2% (v/v), solvent control) for 12 days after initiation of differentiation. Cell culture media is exchanged every second day. On Day 12, 100 µL of the MTT working reagent (0.83 mg/mL MTT diluted in PBS/serum-free media (1:5)), is added to each well, and cells are incubated at 37°C for approximately 15 min. The MTT working solution is removed and the purple formazan formed during incubation is dissolved in 150 µL DMSO per well. Absorbance is measured at 550 nm with 690 nm as reference wavelength using multowell plate reader. The number of metabolically active cells is calculated relative to untreated control cells or the corresponding solvent control (100%)$[^3]$. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
