

Nodinitib-1

Cat. No.:	HY-18639		
CAS No.:	799264-47-4		
Molecular Formula:	C ₁₄ H ₁₃ N ₃ O ₂ S		
Molecular Weight:	287.34		
Target:	NOD-like Receptor (NLR)		
Pathway:	Immunology/Inflammation		
Storage:	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	6 months
		-20°C	1 month

SOLVENT & SOLUBILITY

In Vitro	DMSO : 20 mg/mL (69.60 mM; Need ultrasonic and warming)				
		Solvent Concentration	Mass 1 mg	5 mg	10 mg
	Preparing Stock Solutions	1 mM	3.4802 mL	17.4010 mL	34.8020 mL
		5 mM	0.6960 mL	3.4802 mL	6.9604 mL
10 mM		0.3480 mL	1.7401 mL	3.4802 mL	
Please refer to the solubility information to select the appropriate solvent.					
In Vivo	1. Add each solvent one by one: 10% DMSO >> 90% corn oil Solubility: ≥ 2.5 mg/mL (8.70 mM); Clear solution				

BIOLOGICAL ACTIVITY

Description	Nodinitib-1 (ML130;CID-1088438) is a NOD1 inhibitor with an IC ₅₀ of 0.56 μM.
IC ₅₀ & Target	IC ₅₀ : 0.56 μM (NOD1) ^[1]
In Vitro	Nodinitib-1 selectively inhibits IL-8 production induced by NOD1 ligand. Nodinitib-1 also inhibits γ-tri-DAP-induced expression of the prototypical NF-κB target gene IκBα at the mRNA level. Nodinitib-1 inhibits γ-tri-DAP-dependent activation of NF-κB (IκBα phosphorylation and degradation) and MAPK (p38 phosphorylation) signalings, without affecting Akt survival pathway. Nodinitib-1 selectively inhibits responses of primary dendritic cells to NOD1 ligand. Nodinitib-1 reduces cell surface expression of co-stimulatory molecules CD83, CD86 and HLA-DR and also inhibits expression of IL-1β, IL-6 and TNFα elicited by γ-tri-DAP (but not by LPS), without causing cytotoxicity ^[1] . Nodinitib-1 is identified as NOD1-selective molecules from an HTS campaign involving ~290,000 compounds. Nodinitib-1 inhibits γ-tri-DAP-stimulated luciferase production in HEK 293T cells, which has endogenous NOD1 levels at submicromolar concentration as determined in a NF-κB-linked

reporter assay^[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Cell Assay ^[1]

RAW264.7 cells are treated with 5 μ M of CID-1088438 or CID-44229067 alone, or also infected with *S. typhimurium* at multiplicity of infection (MOI) of 20 and 200 bacteria per mammalian cell. Cell viability is analyzed two hours after *Salmonella* infection by measuring ATP levels. Percentage viability is calculated according to the ATP levels of respective non-infected cells. Values presented are averages of two replicates (+ SEM)^[1].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
