

Peficitinib hydrobromide

Cat. No.:	HY-19568A
CAS No.:	1353219-05-2
Molecular Formula:	C ₁₈ H ₂₃ BrN ₄ O ₂
Molecular Weight:	407.3
Target:	JAK
Pathway:	Epigenetics; JAK/STAT Signaling; Stem Cell/Wnt
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

H-Br

BIOLOGICAL ACTIVITY

Description	Peficitinib (ASP015K) hydrobromide is an orally active JAK inhibitor, with IC ₅₀ s of 3.9, 5.0, 0.7 and 4.8 nM for JAK1, JAK2, JAK3 and Tyk2, respectively ^[1] .											
IC₅₀ & Target	JAK3 0.7 nM (IC ₅₀)	JAK1 3.9 nM (IC ₅₀)	Tyk2 4.8 nM (IC ₅₀)	JAK2 5 nM (IC ₅₀)								
In Vitro	<p>Peficitinib hydrobromide (0-100 nM; 3 days) inhibits IL-2-induced T cell proliferation in a concentration-dependent manner [1].</p> <p>Peficitinib hydrobromide (10-1000 nM) inhibits IL-2-induced STAT5 phosphorylation in a concentration-dependent manner with a mean IC₅₀ of 124 nM in rat whole blood, and inhibits STAT5 phosphorylation with a mean IC₅₀ of 127 nM in human lymphocytes^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>Cell Proliferation Assay^[1]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>Splenocytes from male Lewis rats</td> </tr> <tr> <td>Concentration:</td> <td>0-100 nM</td> </tr> <tr> <td>Incubation Time:</td> <td>3 days</td> </tr> <tr> <td>Result:</td> <td>Inhibited IL-2-induced T cell proliferation in a concentration-dependent manner with an IC₅₀ of 10 nM.</td> </tr> </table>				Cell Line:	Splenocytes from male Lewis rats	Concentration:	0-100 nM	Incubation Time:	3 days	Result:	Inhibited IL-2-induced T cell proliferation in a concentration-dependent manner with an IC ₅₀ of 10 nM.
Cell Line:	Splenocytes from male Lewis rats											
Concentration:	0-100 nM											
Incubation Time:	3 days											
Result:	Inhibited IL-2-induced T cell proliferation in a concentration-dependent manner with an IC ₅₀ of 10 nM.											
In Vivo	<p>Peficitinib hydrobromide (1-30 mg/kg; p.o.; once daily for 24 days) shows dose-dependent efficacy both in prophylactic and therapeutic dosing regimens in an adjuvant-induced arthritis rat model^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1"> <tr> <td>Animal Model:</td> <td>Seven-weeks-old female Lewis rats, adjuvant-induced arthritis (AIA) model^[1]</td> </tr> <tr> <td>Dosage:</td> <td>1, 3, 10, and 30 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>Oral administration, once daily for 24 days</td> </tr> </table>				Animal Model:	Seven-weeks-old female Lewis rats, adjuvant-induced arthritis (AIA) model ^[1]	Dosage:	1, 3, 10, and 30 mg/kg	Administration:	Oral administration, once daily for 24 days		
Animal Model:	Seven-weeks-old female Lewis rats, adjuvant-induced arthritis (AIA) model ^[1]											
Dosage:	1, 3, 10, and 30 mg/kg											
Administration:	Oral administration, once daily for 24 days											

Result:

Significantly inhibited the increase in paw volume at doses of 1 mg/kg or greater with an ED₅₀ value of 2.7 mg/kg (95% confidence interval: 1.5–4.2 mg/kg). Significantly reduced the bone destruction score at 10 mg/kg or greater and almost fully ameliorated both paw swelling and bone destruction scores at 30 mg/kg.
