BIOLOGICAL ACTIVITY

Description	Phentolamine mesylate (Phentolamine methanesulfonate) is a reversible, non-selective, and orally active blocker of α ₁ and α ₂ adrenergic receptor that expands blood vessels to reduce peripheral vascular resistance. Phentolamine mesylate can be used for the research of pheochromocytoma-related hypertension, heart failure and erectile dysfunction ^{[1][2][3]} .
IC₅₀ & Target	α-adrenergic ^[1]
In Vitro	Phentolamine (0.1-1 μM) inhibits the response to Clonidine in rat ileum, with the pA ₂ and pK _B of 7.92 and 8.07, respectively ^[3] . Phentolamine (10-70 μg/mL; 48 h) inhibits proliferation of HDMECs and HBMECs in a dose-dependent manner, with IC ₅₀ s of 50 μg/mL and 30 μg/mL without toxicity, respectively ^[4] .

	<p>Phentolamine (10-20 or 20-40 µg/mL; 12-48 h) significantly delays scratch wound closure of HBMECs and HDMECs in a dose-dependent manner^[4].</p> <p>Phentolamine (30 or 50 µg/mL; 4-12 h) inhibits tube formation of HBMECs and HDMECs^[4].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
In Vivo	<p>Phentolamine (1 mg/kg; i.v.) produces hypotension and tachycardia in rats^[4].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
