

Pentamidine dihydrochloride

Cat. No.:	HY-B0537A
CAS No.:	50357-45-4
Molecular Formula:	C ₁₉ H ₂₆ Cl ₂ N ₄ O ₂
Molecular Weight:	413.34
Target:	Parasite; Fungal; Phosphatase; Bacterial; Antibiotic
Pathway:	Anti-infection; Metabolic Enzyme/Protease
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	<p>Pentamidine dihydrochloride (MP-601205 dihydrochloride) is an antimicrobial agent and interferes with DNA biosynthetics. Pentamidine dihydrochloride inhibits parasite <i>Leishmania infantum</i> with an IC₅₀ of 2.5 μM. Pentamidine dihydrochloride is a potent and selective protein tyrosine phosphatases (PTPases) and phosphatase of regenerating liver (PRL) inhibitor. Pentamidine dihydrochloride has the potential for Gambian trypanosomiasis, antimony-resistant leishmaniasis, and Pneumocystis carinii pneumonia treatment. Antitumor and antibacterial activities^{[1][2][3][4]}.</p>									
IC₅₀ & Target	Trypanosoma	Leishmania								
In Vitro	<p>Pentamidine (0-10 μg/mL; 6 days; WM9, DU145, C4-2, Hey, WM480, and A549 cells) treatment inhibits the growth of cancer cells in a concentration-dependent manner^[1].</p> <p>The cytotoxic properties of Pentamidine isethionate towards the promastigotes of the protozoan parasite Leishmania infantum is determined. The leishmanicidal activity of Pentamidine isethionate is 60 times higher after 72 h of incubation than that of Cisplatin. Pentamidine isethionate induces a higher amount of programmed cell death (PCD) than Cisplatin, which is associated with inhibition of DNA synthesis and cell-cycle arrest in the G2/M phase. Binding of Pentamidine isethionate to calf-thymus DNA (CT-DNA) induces conformational changes in the DNA double helix, consistent with a B→A transition. The interaction of Pentamidine isethionate with ubiquitin leads to a 6% increase in the beta-sheet content of the protein^[2].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>Cell Viability Assay^[1]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>WM9, DU145, C4-2, Hey, WM480, and A549 cells</td> </tr> <tr> <td>Concentration:</td> <td>0-10 μg/mL</td> </tr> <tr> <td>Incubation Time:</td> <td>6 days</td> </tr> <tr> <td>Result:</td> <td>The growth of all six of the cell lines in culture was inhibited in a concentration-dependent manner with complete growth inhibition of the cell lines occurring at 10 μg/mL.</td> </tr> </table>		Cell Line:	WM9, DU145, C4-2, Hey, WM480, and A549 cells	Concentration:	0-10 μg/mL	Incubation Time:	6 days	Result:	The growth of all six of the cell lines in culture was inhibited in a concentration-dependent manner with complete growth inhibition of the cell lines occurring at 10 μg/mL.
Cell Line:	WM9, DU145, C4-2, Hey, WM480, and A549 cells									
Concentration:	0-10 μg/mL									
Incubation Time:	6 days									
Result:	The growth of all six of the cell lines in culture was inhibited in a concentration-dependent manner with complete growth inhibition of the cell lines occurring at 10 μg/mL.									
In Vivo	<p>Pentamidine (0.25 mg/mouse; intramuscular injection; every 2 days; for 4 weeks; athymic nude mice) treatment markedly inhibits the growth of WM9 human melanoma tumors in nude mice^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>									

Animal Model:	Athymic nude mice (6 weeks old) injected with WM9 cells ^[1]
Dosage:	0.25 mg/mouse
Administration:	Intramuscular injection; every 2 days; for 4 weeks
Result:	Markedly inhibited the growth of WM9 human melanoma tumors in nude mice.
