Mulberroside A

Cat. No.: HY-N0619

CAS No.: 102841-42-9

Molecular Formula: $C_{26}H_{32}O_{14}$

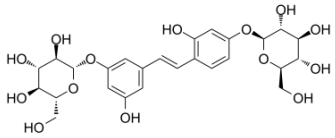
Molecular Weight: 568.52

Target: TNF Receptor; Interleukin Related; Tyrosinase

Pathway: Apoptosis; Immunology/Inflammation; Metabolic Enzyme/Protease

Storage:

Powder	-20°C	3 years
	4°C	2 years
In solvent	-80°C	6 months
	-20°C	1 month



SOLVENT & SOLUBILITY

In Vitro

DMSO : ≥ 100 mg/mL (175.90 mM)

* "≥" means soluble, but saturation unknown.

Preparing Stock Solutions

Concentration / Solvent / Mass	1 mg	5 mg	10 mg
1 mM	1.7590 mL	8.7948 mL	17.5895 mL
5 mM	0.3518 mL	1.7590 mL	3.5179 mL
10 mM	0.1759 mL	0.8795 mL	1.7590 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

1. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
   Solubility: ≥ 2.5 mg/mL (4.40 mM); Clear solution
2. Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
   Solubility: ≥ 2.5 mg/mL (4.40 mM); Clear solution
3. Add each solvent one by one: 10% DMSO >> 90% corn oil
   Solubility: ≥ 2.5 mg/mL (4.40 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

Mulberroside A is one of the main bioactive constituent in mulberry (Morus alba L.)[1]. Mulberroside A decreases the expressions of TNF-α, IL-1β, and IL-6 and inhibits the activation of NALP3, caspase-1, and NF-κB and the phosphorylation of ERK, JNK, and p38, exhibiting anti-inflammatory antiapoptotic effects[2]. Mulberroside A shows inhibitory activity against mushroom tyrosinase with an IC_{50} of 53.6 μM[3].

IC_{50} & Target			
	TNF-α	IL-1β	IL-6

In Vivo

Mulberroside A (10, 20, and 40 mg/kg) decreases serum uric acid levels and increases urinary urate excretion and fractional excretion of uric acid in hyperuricemic micem[4].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model:	Male Kun-Ming mice (20±2 g)[4]
Dosage:	5, 10, 20, and 40 mg/kg; the dose volume 10 mL/kg body weight
Administration:	Orally initiated at 9:00 a.m.
Result:	10, 20, and 40 mg/kg significantly increased urinary urate excretion in 24 h, resulting in a remarkable elevation of fractional excretion of uric acid (FEUA), and the highest dose completely reversed FEUA alteration of hyperuricemic mice to normal.
