

## Jujuboside A

<b>Cat. No.:</b>	HY-N0659		
<b>CAS No.:</b>	55466-04-1		
<b>Molecular Formula:</b>	C <sub>58</sub> H <sub>94</sub> O <sub>26</sub>		
<b>Molecular Weight:</b>	1207.35		
<b>Target:</b>	GABA Receptor		
<b>Pathway:</b>	Membrane Transporter/Ion Channel; Neuronal Signaling		
<b>Storage:</b>	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	2 years
		-20°C	1 year

### SOLVENT & SOLUBILITY

#### In Vitro

DMSO : 100 mg/mL (82.83 mM; Need ultrasonic)  
 H<sub>2</sub>O : 50 mg/mL (41.41 mM; Need ultrasonic)

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	0.8283 mL	4.1413 mL	8.2826 mL
	5 mM	0.1657 mL	0.8283 mL	1.6565 mL
	10 mM	0.0828 mL	0.4141 mL	0.8283 mL

Please refer to the solubility information to select the appropriate solvent.

#### In Vivo

- Add each solvent one by one: PBS  
Solubility: 50 mg/mL (41.41 mM); Clear solution; Need ultrasonic
- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline  
Solubility: ≥ 2.5 mg/mL (2.07 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)  
Solubility: ≥ 2.5 mg/mL (2.07 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil  
Solubility: ≥ 2.5 mg/mL (2.07 mM); Clear solution

### BIOLOGICAL ACTIVITY

#### Description

Jujuboside A is a glycoside extracted from Semen Ziziphi Spinosae, a Chinese herbal medicine used to treat insomnia and anxiety.

#### IC<sub>50</sub> & Target

GABA Receptor, mTOR, PI3K, Akt<sup>[1][2]</sup>

<b>In Vitro</b>	<p>Jujuboside A at the low dose of 41 <math>\mu\text{M}</math> (about 0.05 g/L) induces significant increase of GABA(A) receptor <math>\alpha 1</math>, <math>\alpha 5</math>, <math>\beta 2</math> subunit mRNAs in both 24 and 72h treatments. Jujuboside A at the high dose of 82 <math>\mu\text{M}</math> (about 0.1 g/L) significantly increases GABA(A) receptor <math>\alpha 1</math>, <math>\alpha 5</math> subunit mRNA levels and decreases <math>\beta 2</math> subunit mRNA level at 24h treatment, and decreases GABA(A) receptor subunit <math>\alpha 1</math>, <math>\beta 2</math> mRNAs expression at 72h treatment<sup>[1]</sup>. Jujuboside A pretreatment could reverse the reduction of cell viability and better the injury of H9C2 cells induced by ISO. Jujuboside A could accelerate the phosphorylation of PI3K, Akt, and mTOR. Jujuboside A could significantly decrease the ratio of microtubule-associated protein LC3-II/I in H9C2 cells<sup>[2]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
<b>In Vivo</b>	<p>During daytime (9:00-15:00), jujubosides significantly increases the total sleep and rapid eye movement (REM) sleep without significant influence on non-REM (NREM) sleep. During nighttime (21:00-3:00), jujubosides significantly increases the total sleep and NREM sleep especially the light sleep while shows no significant effect on REM sleep and slow wave sleep (SWS)<sup>[3]</sup>. Intracerebroventricular treatment with Jujuboside A significantly mitigates learning and memory impairment in mice induced by A<math>\beta</math>1-42 as measured by the Y-maze, active avoidance and Morris water maze. Intracerebroventricular treatment with Jujuboside A reduces the level of A<math>\beta</math>1-42 in hippocampus, significantly inhibits the activities of acetylcholinesterase (AChE) and NO, and decreases the amount of the increased malondialdehyde (MDA) in the hippocampus and cerebral cortex of mice treated with intracerebroventricular injection of A<math>\beta</math>1-42<sup>[4]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>

## PROTOCOL

<b>Cell Assay</b> <sup>[1]</sup>	<p>After 7 days in culture in vitro, cells are exposed continuously for the next 24 or 72 h to the culture medium with either Jujuboside A or diazepam, or neither of them. Vehicle is added for the control group; 10 <math>\mu\text{M}</math> diazepam is added for the diazepam group; Jujuboside A 82 <math>\mu\text{M}</math> (about 0.1 g/L) and 41 <math>\mu\text{M}</math> (about 0.05 g/L) are added for the JuA-H (high dose Jujuboside A) and the JuA-L (low dose Jujuboside A) groups respectively. Total RNA is isolated from cells for further analysis <sup>[1]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
<b>Animal Administration</b> <sup>[1]</sup>	<p>Mice: Cognitive impairment of mice is induced by ICV injection of A<math>\beta</math>1-42. Then mice are given intracerebroventricular (ICV) injection of Jujuboside A (0.02 and 0.2 mg/kg) for five consecutive days. Y-maze, active avoidance and Morris water maze tests are performed on mice<sup>[1]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
