BIOLOGICAL ACTIVITY

Description

Ganoderic acid A can inhibit of the JAK-STAT3 signaling pathway, also inhibit proliferation, viability, ROS.

In Vitro

A lower doses of Ganoderic acid A enhance HLA class II-mediated antigen presentation and CD4+ T cell recognition of lymphoma^[1].
 Ganoderic acid A promotes cisplatin-induced cell death by enhancing the sensitivity of HepG2 cells to cisplatin mainly via the signal transducer and activator of transcription 3 suppression^[2].
 Ganoderic acid A inhibits proliferation, viability, ROS, DPPH, and analyzed the expression of SOD1, SOD2, and SOD3 by Real

	<p>time PCR in a PC-3 cell in a dose-dependent manner^[3]. Ganoderic acid A effectively inhibits the proliferation of human osteosarcoma HOS and MG-63 cells in a dose-dependent manner, and induced obvious cell apoptosis in both cells^[4]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
In Vivo	<p>Ganoderic acid A treatment significantly prolonged survival of EL4 challenged mice and decreased tumor metastasis to the liver^[4]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
