Stauprimide

Cat. No.: HY-N6747

CAS No.: 154589-96-5

Molecular Formula: $C_{35}H_{28}N_4O_5$

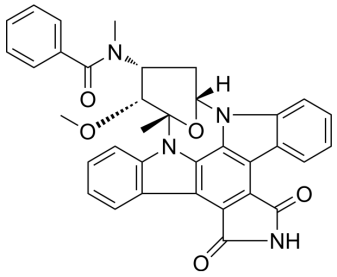
Molecular Weight: 584.62

Target: c-Myc; Autophagy

Pathway: Apoptosis; Autophagy

Storage: -20°C, stored under nitrogen

* In solvent : -80°C, 6 months; -20°C, 1 month (stored under nitrogen)



SOLVENT & SOLUBILITY

In Vitro

DMSO : 10 mg/mL (17.11 mM; Need ultrasonic and warming)

Preparing Stock Solutions	Solvent / Mass / Concentration	1 mg	5 mg	10 mg
	1 mM	1.7105 mL	8.5526 mL	17.1051 mL
	5 mM	0.3421 mL	1.7105 mL	3.4210 mL
	10 mM	0.1711 mL	0.8553 mL	1.7105 mL

Please refer to the solubility information to select the appropriate solvent.

BIOLOGICAL ACTIVITY

Description

Stauprimide is a staurosporine analog that promotes embryonic stem cell (ESC) differentiation. Stauprimide is a non-broad spectrum inhibitor that binds to the MYC transcription factor NME2 and blocks its nuclear localization in ESCs, which results in down-regulation of MYC transcription[1].

In Vitro

Stauprimide (10 μM; 6 hours) suppresses MYC transcription in the majority of cell lines tested with an EC_{50} range of 30 nM-8 μM, and decreases MYC levels between 15% to over 90%[1].

Stauprimide (2-8 μM; 24-72 hours) down-regulates MYC leads to the inhibition of cell proliferation in vitro with an IC_{50} of 780 nM in RXF 393 cells[1].

Stauprimide (5 μM; 3 hours) suppresses MYC Transcription by decreasing NME2 Nuclear Translocation[1].

Stauprimide (4-10 μM; 6 hours) acts with different EC_{50}s and with different degrees of maximal MYC mRNA down-regulation in different cell lines[1].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Cell Proliferation Assay[1]

Cell Line:	Renal cancer cell line RXF 393 cells

Concentration:	2 μM, 4 μM, 8 μM
Incubation Time:	24 hours, 48 hours, 72 hours
Result:	Inhibited cell proliferation at concentrations of 2-8 μM.

Western Blot Analysis[1]

Cell Line:	Renal cancer cell line RXF 393 cells and CAKI-1 cells
Concentration:	5 μM
Incubation Time:	3 hours
Result:	Decreased nuclear localized NME2.

RT-PCR[1]

Cell Line:	CA46 cells; Ramos cells; RXF393 cells; TK10 cells; KG1A cells; CAKI-1 cells
Concentration:	4μM, 6μM, 8μM, 10μM
Incubation Time:	6 hours
Result:	Suppressed MYC transcription in KG1A cells with an EC_{50} of 400±50 nM and a suppression of 90%; CA46 cells were resistant to stauprimide.

In Vivo

Stauprimide (oral administration; 50 mg/kg; once daily; 30 days, 55 days) blocks tumor growth, reduces MYC protein levels in xenograft mouse with RXF 393 or CAKI-1 cells and inhibits MYC transcription in the RXF 393 tumor[1].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model:	Xenograft tumor models with RXF 393 and CAKI-1 cells in NOD/SCID mice[1]
Dosage:	50 mg/kg
Administration:	Oral administration; 50 mg/kg; once daily; 30 days, 55 days
Result:	Blocked tumor growth in mice injected with either RXF 393 or CAKI-1 cells during the dosing periods.
