

Murepavadin

Cat. No.:	HY-P1674
CAS No.:	944252-63-5
Molecular Formula:	C ₇₃ H ₁₁₂ N ₂₂ O ₁₆
Molecular Weight:	1553.81
Sequence:	Cyclo(Ala-Ser-{d-Pro}-Pro-Thr-Trp-Ile-{Dab}-{Orn}-{d-Dab}-{Dab}-Trp-{Dab}-{Dab})
Sequence Shortening:	Cyclo(AS-{d-Pro}-PTWI-{Dab}-{Orn}-{d-Dab}-{Dab}-W-{Dab}-{Dab})
Target:	Bacterial; Antibiotic
Pathway:	Anti-infection
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	Murepavadin (POL7080), a 14-amino-acid cyclic peptide, is a highly potent, specific antibiotic. Murepavadin exhibits a potent antimicrobial activity for <i>P. aeruginosa</i> with both MIC ₅₀ and MIC ₉₀ values of 0.12 mg/L. Murepavadin also can target the lipopolysaccharide transport portin D. Murepavadin can be used for the research of bacterial resistance ^{[1][2]} .																
IC₅₀ & Target	MIC ₅₀ : 0.12 mg/L(<i>P. aeruginosa</i>) ^[2] MIC ₉₀ : 0.12 mg/L(<i>P. aeruginosa</i>) ^[2] IC ₅₀ : 5.84 μM (gentamicin) ^[2]																
In Vitro	Murepavadin has activity against <i>P. aeruginosa</i> with MIC ₅₀ and MIC ₉₀ values both of 0.12 mg/L ^[2] . Murepavadin inhibits megalin-mediated uptake of gentamicin in vitro with an IC ₅₀ value of 5.84 μM ^[2] . MCE has not independently confirmed the accuracy of these methods. They are for reference only.																
In Vivo	<p>Murepavadin (s.c.; 0-100 mg/kg) is active in pre-clinical animal models including infections with XDR isolates^[2]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table> <tr> <td>Animal Model:</td> <td>murine models of <i>P. aeruginosa</i> infection^[2]</td> </tr> <tr> <td>Dosage:</td> <td>0-100 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>Subcutaneous, q24h or q12h</td> </tr> <tr> <td>Result:</td> <td>Resulted in an increase in survival rate to 100% and showed significantly lower CFU levels both in the blood and in the peritoneal fluid at 2 and 10 mg/kg 1 h post-infection.</td> </tr> </table> <table> <tr> <td>Animal Model:</td> <td>Mouse, rat, rabbit, and monkey^[2]</td> </tr> <tr> <td>Dosage:</td> <td>0-5 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>Intraperitoneal or subcutaneous, single</td> </tr> <tr> <td>Result:</td> <td>Followed a two-compartment model following intravenous administration and decline of plasma concentrations. Distributed into the aqueous phase of the body, and systemic plasma clearance (CL)</td> </tr> </table>	Animal Model:	murine models of <i>P. aeruginosa</i> infection ^[2]	Dosage:	0-100 mg/kg	Administration:	Subcutaneous, q24h or q12h	Result:	Resulted in an increase in survival rate to 100% and showed significantly lower CFU levels both in the blood and in the peritoneal fluid at 2 and 10 mg/kg 1 h post-infection.	Animal Model:	Mouse, rat, rabbit, and monkey ^[2]	Dosage:	0-5 mg/kg	Administration:	Intraperitoneal or subcutaneous, single	Result:	Followed a two-compartment model following intravenous administration and decline of plasma concentrations. Distributed into the aqueous phase of the body, and systemic plasma clearance (CL)
Animal Model:	murine models of <i>P. aeruginosa</i> infection ^[2]																
Dosage:	0-100 mg/kg																
Administration:	Subcutaneous, q24h or q12h																
Result:	Resulted in an increase in survival rate to 100% and showed significantly lower CFU levels both in the blood and in the peritoneal fluid at 2 and 10 mg/kg 1 h post-infection.																
Animal Model:	Mouse, rat, rabbit, and monkey ^[2]																
Dosage:	0-5 mg/kg																
Administration:	Intraperitoneal or subcutaneous, single																
Result:	Followed a two-compartment model following intravenous administration and decline of plasma concentrations. Distributed into the aqueous phase of the body, and systemic plasma clearance (CL)																

values were similar to the species-specific glomerular filtration rates (GFRs) .
Had high bioavailability (67.79%) after subcutaneous (s.c.) administration in rats but had low oral bioavailability (<0.01%).
Had a linear relationship between ELF AUC and unbound plasma AUC in mouse.
Did not readily cross the blood/brain barrier.
