

## Murepavadin TFA

**Cat. No.:** HY-P1674A

**Molecular Formula:**  $C_{73}H_{112}N_{22}O_{16}C_2HF_3O_2$

**Molecular Weight:** 1667.83

**Sequence Shortening:** Cyclo(AS-{d-Pro}-PTWI-{Dab}-{Orn}-{d-Dab}-{Dab}-W-{Dab}-{Dab})

**Target:** Bacterial; Antibiotic

**Pathway:** Anti-infection

**Storage:** Sealed storage, away from moisture

Cyclo(AS-{d-Pro}-PTWI-{Dab}-{Orn}-{d-Dab}-{Dab}-W-{Dab}-{Dab}) (TFA salt)

Powder -80°C 2 years  
-20°C 1 year

\* In solvent : -80°C, 6 months; -20°C, 1 month (sealed storage, away from moisture)

### SOLVENT & SOLUBILITY

In Vitro	H <sub>2</sub> O : 50 mg/mL (29.98 mM; Need ultrasonic)					
	Preparing Stock Solutions	<div>Solvent Concentration</div>	Mass	1 mg	5 mg	10 mg
		1 mM		0.5996 mL	2.9979 mL	5.9958 mL
		5 mM		0.1199 mL	0.5996 mL	1.1992 mL
		10 mM		0.0600 mL	0.2998 mL	0.5996 mL
	Please refer to the solubility information to select the appropriate solvent.					
In Vivo	1. Add each solvent one by one: PBS Solubility: 25 mg/mL (14.99 mM); Clear solution; Need ultrasonic and warming					

### BIOLOGICAL ACTIVITY

Description	Murepavadin (POL7080) (TFA), a 14-amino-acid cyclic peptide, is a highly potent, specific antibiotic. Murepavadin exhibits a potent antimicrobial activity for <i>P. aeruginosa</i> with MIC <sub>50</sub> and MIC <sub>90</sub> values both of 0.12 mg/L. Murepavadin also can target the lipopolysaccharide transport portin D. Murepavadin can be used for the research of bacterial resistance <sup>[1][2]</sup> .
IC <sub>50</sub> & Target	MIC <sub>50</sub> : 0.12 mg/L( <i>P. aeruginosa</i> ) <sup>[2]</sup> MIC <sub>90</sub> : 0.12 mg/L( <i>P. aeruginosa</i> ) <sup>[2]</sup> IC <sub>50</sub> : 5.84 μM (gentamicin) <sup>[2]</sup>
In Vitro	Murepavadin has activity against <i>P. aeruginosa</i> with MIC <sub>50</sub> and MIC <sub>90</sub> values both of 0.12 mg/L <sup>[2]</sup> . Murepavadin inhibits megalin-mediated uptake of gentamicin in vitro with an IC <sub>50</sub> value of 5.84 μM <sup>[2]</sup> . MCE has not independently confirmed the accuracy of these methods. They are for reference only.
In Vivo	Murepavadin (s.c.; 0-100mg/kg) is active in pre-clinical animal models including infections with XDR isolates <sup>[2]</sup> . MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Model:	Murine models of <i>P. aeruginosa</i> infection <sup>[2]</sup>
Dosage:	0-100 mg/kg
Administration:	Subcutaneous, q24h or q12h
Result:	Resulted in an increase in survival rate to 100% and showed significantly lower CFU levels both in the blood and in the peritoneal fluid at 2 and 10 mg/kg 1 h post-infection.

Animal Model:	Mouse, rat, rabbit, and monkey <sup>[2]</sup>
Dosage:	0-5 mg/kg
Administration:	Intraperitoneal or subcutaneous, single
Result:	<p>Followed a two-compartment model following intravenous administration and decline of plasma concentrations.</p> <p>Distributed into the aqueous phase of the body, and systemic plasma clearance (CL) values were similar to the species-specific glomerular filtration rates (GFRs) .</p> <p>Had high bioavailability (67.79%) after subcutaneous (s.c.) administration in rats but had low oral bioavailability (&lt;0.01%).</p> <p>Had a linear relationship between ELF AUC and unbound plasma AUC in mouse.</p> <p>Did not readily cross the blood/brain barrier.</p>
