DESCRIPTION

Background	ZFAND3 is a transcriptional regulatory protein that regulates the expression of adhesion and invasion related genes, and can drive the invasion of glioblastoma. ZFAND3 plays a role in nuclear protein complexes, activating gene transcription and regulating the promoters of invasion related genes such as COL6A2, FN1, and NRCAM. In addition, ZFAND3 can improve glucose tolerance by improving insulin resistance and inhibiting gluconeogenesis, and is identified as a susceptibility gene for type 2 diabetes ^{[1][2]} .
