DESCRIPTION	
Background	SPIN4 protein showcases H3K4me3-binding activity, indicating its affinity for histone H3 trimethylated at lysine 4. This unique binding ability suggests a potential role for SPIN4 in recognizing specific chromatin modifications, implicating it the regulation of gene expression or chromatin dynamics. Additionally, SPIN4 interacts with C11orf84/SPINDOC, indica potential partnership or functional association with this interacting protein. These molecular interactions underscore t intricate involvement of SPIN4 in epigenetic processes and protein-protein interactions, hinting at its potential signification in cellular regulation and chromatin-related functions.
