DESCRIPTION

Background

Thrombomodulin, a distinctive endothelial cell receptor, establishes a precise 1:1 stoichiometric complex with thrombin, playing a crucial role in the regulation of coagulation. This complex facilitates the conversion of protein C to its activated form, protein Ca. Once activated, protein Ca acts by cleaving the activated cofactors of the coagulation cascade, namely factor Va and factor VIIIa, effectively curbing the generation of thrombin. Thrombomodulin's interaction with ITGAL, ITGAM, and ITGB2 further underscores its involvement in modulating immune responses.
