DESCRIPTION

Background	<p>Interleukin-13 is a cytokine which is secreted by activated T lymphocytes and primarily impacts monocytes, macrophages, and B cells. The circular dichroism spectrum confirms that interleukin-13 belongs to the alpha-helical family of cytokines. Interleukin-13 affects the morphology, growth, and surface antigen expression and phenotype of monocytes and elicits B cell proliferation, Ig class switching to IgE synthesis, and enhanced production of IgG4 and IgM. In human macrophages and monocytes, hIL-13 has been shown to inhibit HIV replication. Human IL-13 also inhibits proinflammatory cytokines induced by LPS exposure, indicating potential therapeutic applications as an anti-inflammatory agent^[1].</p>
