DESCRIPTION

Background	PVR/CD155, also known as the human poliovirus receptor (PVR) is a member of the subfamily of immunoglobulin (Ig)-like
------------	---

molecules composed of an N-terminal variable-like, followed by two constant-like extracellular domains, a single transmembrane region and a cytoplasmic tail of variable length. CD155 binds the extracellular matrix protein vitronectin thereby mediating cell to matrix contacts. The cytoplasmic tail of CD155 interacts with the μ 1B subunit of the clathrin adaptor complex resulting in directed transport of CD155 in polarized epithelial cells^{[1][2]}.
