## DESCRIPTION

Background
The TNFRSF12A protein acts as a receptor for TNFSF12/TWEAK, with a weak ability to induce apoptosis in certain cell types. Additionally, it plays a role in promoting angiogenesis and stimulating the proliferation of endothelial cells. TNFRSF12A may also modulate cellular adhesion to matrix proteins. In its functional interactions, TNFRSF12A associates with TRAF1 and TRAF2, and possibly with TRAF3, indicating its involvement in signaling pathways that contribute to various cellular processes
