

MEK1 Protein, Mouse (sf9)

Cat. No.:	HY-P73826
Synonyms:	Dual specificity mitogen-activated protein kinase kinase 1; MAPKK 1; MEK 1; Map2k1
Species:	Mouse
Source:	Sf9 insect cells
Accession:	P31938 (N-G&P, M1-I393)
Gene ID:	26395
Molecular Weight:	Approximately 45 kDa

PROPERTIES

Biological Activity	The enzyme activity of this recombinant protein is testing in progress, we cannot offer a guarantee yet.
Appearance	Solution.
Formulation	Supplied as a 0.2 µm filtered solution of 20 mM Tris, 500 mM NaCl, 10% glycerol, pH 8.0.
Endotoxin Level	<1 EU/µg, determined by LAL method.
Reconstitution	N/A.
Storage & Stability	Stored at -80°C for 1 year. It is stable at -20°C for 3 months after opening. It is recommended to freeze aliquots at -80°C for extended storage. Avoid repeated freeze-thaw cycles.
Shipping	Shipping with dry ice.

DESCRIPTION

Background	MEK1 protein, a pivotal component of the MAP kinase signal transduction pathway, plays a crucial role in transducing extracellular signals into intracellular responses. Upon binding of ligands such as growth factors and cytokines to their cell-surface receptors, MEK1 is activated as part of the RAS-RAF1-MEK1/2-MAPK/ERK cascade. MEK1, along with MAP2K2/MEK2, catalyzes the dual phosphorylation of threonine and tyrosine residues in the activation loop of ERK1 and ERK2, thereby initiating downstream signaling events. This cascade regulates diverse biological functions, including cell growth, adhesion, survival, and differentiation. In addition to its role in the transcriptional and cytoskeletal regulation, the MAPK/ERK pathway impacts peroxisome proliferator-activated receptor gamma (PPARG), contributing to cellular processes such as differentiation and apoptosis. Furthermore, MEK1's involvement in endosomal dynamics and Golgi apparatus fragmentation during mitosis underscores its versatility in coordinating intricate cellular responses.
