### DESCRIPTION

<b>Background</b>	CART protein, a satiety factor intricately linked to the functions of leptin and neuropeptide Y, acts as an anorectic peptide by effectively suppressing both regular and starvation-triggered feeding. Furthermore, it robustly inhibits the feeding response initiated by neuropeptide Y and governed by leptin within the hypothalamus. Beyond its role in appetite regulation, CART protein also plays a pivotal role in fostering neuronal development and survival when studied in vitro.
