DESCRIPTION	
Background	SARS-Cov-2 is a enveloped positive-sense single-stranded RNA virus that causes COVID-19.
	SARS-CoV-2 possesses four structural proteins, namely the envelope protein (E), spike or surface glycoprotein (S), membrane protein (M), and nucleocapsid protein (N).
	The SARS-Cov-2 S glycoprotein is located on the exterior of the viral particle, giving the coronavirus its crown-like
	appearance. The SARS-Cov-2 S glycoprotein can mediate the attachment and entry of viral particles into host cells and is an importa
	target for vaccine development, antibody therapy, and antigen-based diagnostic esting ^{[1][2][3][4][5]} .
