

## SARS-CoV Nucleoprotein/NP Protein (sf9, His)

Cat. No.:	HY-P74582
Synonyms:	Nucleoprotein; Ebola NP; eNP; Protein N; NP
Species:	Virus
Source:	Sf9 insect cells
Accession:	NP_828858 (M1-A422)
Gene ID:	1489678
Molecular Weight:	Approximately 47.1 kDa

### PROPERTIES

Appearance	Lyophilized powder.
Formulation	Lyophilized from a 0.2 µm filtered solution of 20 mM Tris, 500 mM NaCl, 10% Glycerol, pH 7.4. Normally 5 % - 8 % trehalose, mannitol and 0.01% Tween 80 are added as protectants before lyophilization.
Endotoxin Level	<1 EU/µg, determined by LAL method.
Reconstitution	It is not recommended to reconstitute to a concentration less than 100 µg/mL in ddH <sub>2</sub> O.
Storage & Stability	Stored at -20°C for 2 years. After reconstitution, it is stable at 4°C for 1 week or -20°C for longer (with carrier protein). It is recommended to freeze aliquots at -20°C or -80°C for extended storage.
Shipping	Room temperature in continental US; may vary elsewhere.

### DESCRIPTION

Background	<p>SARS-CoV Nucleoprotein (NP, N) is a homodimer composed of 422 amino acids in each chain. NP can be divided into two structural domains interspersed with disordered (unstructured) regions: the N-terminal domain (NTD; also called RBD) serves as a putative RNA-binding domain, while the C-terminal domain (CTD; also called DD) is a dimerization domain, both the NTD and the CTD bind to nucleic acids through electropositive regions on their surfaces.</p> <p>NP is one of the most abundant coronavirus proteins with nonspecific binding activity toward nucleic acids, including ssRNA, single-stranded DNA, and double-stranded DNA, NP can also act as an RNA chaperone. NP packages the positive strand viral genome RNA into a helical ribonucleocapsid (RNP) and plays a fundamental role during virion assembly through its interactions with the viral genome and membrane protein M. NP plays an important role in enhancing the efficiency of subgenomic viral RNA transcription as well as viral replication<sup>[1]</sup>.</p>
