

DR6/TNFRSF21 Protein, Mouse (349a.a, HEK293, His)

Cat. No.:	HY-P75278
Synonyms:	Tumor necrosis factor receptor superfamily member 21; CD358; Tnfrsf21; DR6
Species:	Mouse
Source:	HEK293
Accession:	Q9EPU5 (M1-H349)
Gene ID:	94185
Molecular Weight:	55-60 kDa

PROPERTIES

Appearance	Lyophilized powder.
Formulation	Lyophilized from a 0.2 µm filtered solution of PBS, pH 7.4. Normally 5 % - 8 % trehalose, mannitol and 0.01% Tween 80 are added as protectants before lyophilization.
Endotoxin Level	<1 EU/µg, determined by LAL method.
Reconstitution	It is not recommended to reconstitute to a concentration less than 100 µg/mL in ddH ₂ O.
Storage & Stability	Stored at -20°C for 2 years. After reconstitution, it is stable at 4°C for 1 week or -20°C for longer (with carrier protein). It is recommended to freeze aliquots at -20°C or -80°C for extended storage.
Shipping	Room temperature in continental US; may vary elsewhere.

DESCRIPTION

Background	<p>The DR6/TNFRSF21 Protein is involved in multiple cellular processes. It promotes apoptosis through various pathways, including activation of NF-kappa-B, BAX-mediated apoptosis, and release of cytochrome c from mitochondria. It plays a crucial role in neuronal apoptosis, particularly in response to amyloid peptides derived from APP, and is essential for normal cell body death and axonal pruning. Additionally, it regulates oligodendrocyte survival, maturation, and myelination negatively. In the context of the adaptive immune response, it participates in signaling cascades triggered by T-cell receptors, influencing T-cell differentiation, proliferation, and cytokine release. Moreover, it inhibits JNK activation upon T-cell stimulation and negatively regulates IgG, IgM, and IgM production in response to antigens. It also functions as a regulator of pyroptosis, recruiting CASP8 in response to reactive oxygen species and oxidation, leading to GSDMC activation. The DR6/TNFRSF21 Protein interacts with NGFR, CASP8, and N-APP, and associates with TRADD.</p>
