DESCRIPTION

Background

SARS-Cov-2 is a enveloped positive-sense single-stranded RNA virus that causes COVID-19.

SARS-CoV-2 possesses four structural proteins, namely the envelope protein (E), spike or surface glycoprotein (S), membrane protein (M), and nucleocapsid protein (N).

The SARS-Cov-2 S glycoprotein is located on the exterior of the viral particle, giving the coronavirus its crown-like appearance.

The SARS-Cov-2 S glycoprotein can mediate the attachment and entry of viral particles into host cells and is an important $target for vaccine \ development, antibody \ the rapy, and \ antigen-based \ diagnostic \ esting^{\hbox{\scriptsize [1][2][3][4][5]}}.$
