## DESCRIPTION

## Background

The CD3 epsilon protein, a vital component of the TCR-CD3 complex on T-lymphocytes, is pivotal for adaptive immune responses. When antigen presenting cells (APCs) activate T-cell receptor (TCR), TCR-mediated signals are transmitted across the cell membrane by the CD3 chains CD3D, CD3E, CD3G and CD3Z. CD3E is crucial for proper T-cell development and contributes to TCR-CD3 complex internalization and down-regulation. The CD3D/CD3E and CD3G/CD3E heterodimers form trimers with TCRalpha and TCRbeta, completing the TCR-CD3 complex. CD3E's interactions with CD6 and NCK1 highlight its multifaceted role in T-cell responses ${ }^{[1]}$.
